

mentioned whereby prairie dogs moving through the tunnel drive the air out ahead of them and draw it in behind them. Everyone is familiar with the "whoosh" effect observed when subway trains come in. (My thought is that a tight fitting, fast moving, animal could well do this. But I expect that the animal fills only about 1/2 of the tube cross section. The tube radius is 5.64 cm versus an animal diameter of about 8-9 cm. Thus his sweeping efficiency may not be too good and a fairly continuous circulation might be required. Note also that this mechanism would not work during hibernation.)

b. The Bernoulli effect (high velocity, low pressure, and vice versa) is mentioned with no particular indication of the mechanism of getting high and low velocities. Perhaps there is a "mound" effect. There may be a variety of misconceptions about static air pressure; e.g., can the different elevations of openings induce flow simply because of Δp ? In fact, Δp is balanced by gravity and it is impossible to vent pollutants to the vacuum of space.

c. A variety of chimney effects are possible; e.g. sucking at all openings due to wind across them and natural convection due to animal warmth below. The day-night cycle could give an effect similar to the breathing cave phenomenon.

d. Finally, if a tube is held vertically just above the ground, would there be flow through it? There will be a flow upward

FIGURE 2. Boundary layer velocity distribution effect.

due to the boundary layer velocity distribution effect because of the low velocity and high pressure at the bottom and the high velocity and low pressure at the top. This Δp is greater than that inferred from hydrostatics.

You are now encouraged to use any of the above points in your explanation of the tunnel ventilation mechanism. □

 1/2 page \$50; each additional column inch \$20.

UNIVERSITY OF TEXAS AT AUSTIN

Assistant Professor of Chemical Engineering: Must have a Ph.D., excellent academic background, strong interest in teaching and research, and be a U.S. citizen or have permanent residency certification. Responsible for teaching undergraduate and graduate courses, supervising graduate research starting September 1980 or January 1981. Send resume, three references, transcripts, and statement of interest to Dr. D. R. Paul, Chairman, Department of Chemical Engineering, The University of Texas at Austin, Austin, TX 78712. Affirmative Action/Equal Opportunity Employer.

OKLAHOMA STATE UNIVERSITY

Assistant or Associate Professor Position. This is a tenure-track position and will be approximately half-time teaching and half-time research. We will help the successful candidate establish research by providing initiation funds, co-investigation opportunities with senior faculty, and proposal preparation-processing assistance from our Office of Engineering Research. Candidates must possess an earned Ph.D. degree from an accredited Department or School of Chemical Engineering or have a Ph.D. degree in related area and have strongly related qualifications. We welcome applications from candidates with competencies and interests in any field of chemical engineering, but especially seek those with strengths in material sciences or controls. The position is available as early as July, 1980. Applications will be received thru June, 1980. Salary and rank are commensurate with qualifications and experience. If you are interested in joining an established School of Chemical Engineering (in the pleasant Southwest) that offers outstanding professional growth opportunities, please send your resume and list of three references to: Professor Billy L. Crynes, Head, School of Chemical Engineering, 423 Engineering North, Oklahoma State University, Stillwater, Oklahoma 74078, 405-624-5280. (Calls for additional information invited.) OSU is an equal opportunity/affirmative action employer.

ChE books received

"How to Find Chemical Information," R. E. Maizell, John Wiley & Sons, New York, 1979, 261 pages, \$17.95.

Chemical information tools are in a constant state of change. This book will show you how to efficiently locate, use, and in some cases evaluate, chemical data. "Fluid Catalytic Cracking with Zeolite Catalysts," P. B. Venuto and E. T. Habib, Jr., Marcel Dekker, Inc., New York, 1979 156 pages, \$19.50

This book attempts to cover the broad scope of fluid catalytic cracking (using zeolite catalysts), with emphasis on the highly-coupled interactions of the process between the feedstock, the catalyst, the process hardware, and the desired products. Workers in petroleum refining and petro-chemical activities, and those interested in catalysis in general, will use this book as a resource and necessary research tool.
