

FOR A CHEMICAL ENGINEER

**A good career  
decision  
is like a good  
stew—  
many things  
should go into it!**

Technical challenge, for example, is an important consideration.

At Procter & Gamble, you'll find as much as you can handle. As a major chemical process industry involved in a very wide range of product and process development activities, we welcome chemical engineers who like a challenge. You need only pick the direction that interests you most!

A company's stability, despite abrupt changes in the economy, is another important consideration in making your career choice. As is the growth record of your prospective employer.

At P&G we make and sell things that people need and buy, in good times and bad. According to Fortune magazine, "One or more P&G products are used in 95 out of 100 homes, a penetration unequaled by any other manufacturer of anything!"

P&G sales and earnings have increased every year since 1952. Net sales have doubled in less than 10 years, to more than \$6 billion. New products and product improvements are being added continually.

**And if you're interested in benefits, consider our Profit-Sharing Trust Plan. The performance of this Plan to date has enabled P&G monthly salaried employees to retire at 65 with a lump sum amount equal to about 15 times their average career annual salary. This is without cost to the employee.**

Technical challenge. Substantial initial responsibility. Advancement on merit alone. Stability in good times and bad. A company marked by vigorous growth. A benefits program that ranks among the top 5% of all U. S. companies. Good reasons to see the P&G recruiter when he visits your campus!
