**Equations with Applications**

RUTHERFORD B. ARIS  
and NEAL R. AMUNDSON,  
both of the University of  
Minnesota

An extended treatment of first-order equations that includes a wide variety of applications, particularly for those who are not mathematicians. Examples are drawn from a considerable range of scientific and engineering disciplines. Topics covered include: the characteristics and craft of constructing models dominated by convective phenomena; the differences between linear, quasi-linear, and nonlinear equations; the traditional methods of the Laplace transform and the connection with the calculus of variations; some of the ideas of weak solutions; an introduction into the work of Lax and others; the equations of chromatography; reducible systems; and wave and discontinuous solutions.

**Dynamic Behavior of  
Processes**

JOHN C. FRIEDLY,  
University of Rochester  
Provides a complete and systematic study of the analysis of unsteady state phenomena. Emphasizes physical interpretation of dynamic linear and nonlinear responses as well as methods of analysis. Covers both distributed parameter and lumped systems. Classes of system models prepare reader to generalize readily to other systems and to diverse fields of application. Over 100 detailed examples illustrate the fundamentals and varieties of applications. Over 200 figures present results graphically. Appendices include vector and matrix manipulation and Laplace transform pairs for easy reference.

**Electrochemical Systems**

JOHN NEWMAN, University  
of California, Berkeley  
Unified framework for the analysis of problems in electrochemical systems. Clearly develops the fundamentals of thermodynamics, electrode kinetics, and charge and mass transport, with a view toward their application to a wide variety of electrochemical engineering problems. Emphasizes aspects which can be treated quantitatively, especially problems of scale up. Introduces the beginning student to the development, design, and operation of electrochemical syntheses, processes, energy conversion and storage devices, and corrosion. Problems at the end of each chapter clarify and extend the theories developed. Numerous examples are worked out in the text.
