

This could  
be the start  
of a  
promising  
career.

## *Environmental Protection.*

Ecology is part of it. So is toxicology. And most important of all, chemical technology. It takes a professional knowledge of all these disciplines, plus determination, to help protect our natural surroundings.

We're developing new methods for controlling industrial contamination of our air, water, soil and surroundings. For some of us this constitutes a full time career. But it's a major concern for all of us.

In today's world industrial sophistication and expansion have reached the point where complete careers can be found in environmental protection. Not only can be found; **MUST** be found. Preserving our natural resources takes a lifetime of experience, skills and stubborn resolve.

Everyone must participate in helping to maintain the vital ecological balance. For environmental involvement is literally the breath of life for everyone.  
Dow Chemical, U.S.A.
