

The annual ASEE Meeting will be held at Los Angeles, Calif. on June 17-20, 1968. The ChE Program Chairman for the meeting is Dr. D. K. Anderson, Chemical Engineering Department, Michigan State University, East Lansing, Michigan 48823. The program follows:

Monday, June 17

12:00- 1:30 P.M. Executive Committee Meeting
Committee Dr. L. Bryce Andersen, Presiding

Tuesday, June 18

10:00-11:30 A.M. Annual Distinguished Lecturer
Lecture Dr. George Burnet, Presiding

12:00- 1:30 P.M. Annual Division Business Meeting
Luncheon Dr. L. Bryce Andersen, Presiding

1:45- 5:30 P.M. Frontier Areas in Chemical
Conference Engineering
Dr. L. Bryce Andersen, Presiding

Wednesday, June 19

10:00-11:30 A.M. New Approach to Teaching Chemical
Conference Engineering
Dr. Donald K. Anderson, Presiding

1:45- 3:30 P.M. Meeting of Chemical Engineering
Conference Department Heads
Dr. Wm. H. Honstead, Presiding

6:00- 7:45 P.M. Annual Chemical Engineering
Banquet Division Banquet
Dr. L. Bryce Andersen, Presiding

Speaker: Silas A. Bradley
Dow Corning Center for Aid to
Medical Research
"Artificial Internal Organs"

The program papers feature two areas of interest to ChE Educators.

I. New Approaches to Teaching Chemical Engineering

The New Stoichiometry, E. J. Henley and E. M. Rosen
A Self-pacing, Auto-graded Course, G. David Schilling
Chemical Engineering Laboratory—An Integrated Approach, John R. Thygeson
University-Industry Partnerships in Design Education
Buford D. Smith
Teaching Optimization Methods, Louis L. Edwards

II. Frontier Areas in Chemical Engineering

An Environmental Focus for Engineering Education
Seymour Calvert
Education for a New Environment-Bioomedical
Engineering, Richard C. Seagrave
Ocean Engineering, Carl H. Gibson
Space Engineering, John L. Mason

Readers are again urged to send publishable solutions to the problems for teachers in volume 2, no. 1 of CEE either to Dr. Levenspiel or to the Editor.

The following problems were written by Professors R. K. Irey and J. H. Pohl at the University of Florida. Readers may send solutions to the Editor. The solution will be published in a future issue dealing with thermodynamics.

1. For a single component closed system, the Gibbs equation is written as

$$du = Tds - \sum_{j=1}^N \vec{F}_j \cdot d\vec{x}_j$$

The F_j 's and x_j 's are the generalized forces and displacements of the N reversible work modes.

- Develop a set of $N + 1$ equations relating the partial derivatives of u to thermodynamic functions.
- Develop $N + 1$ Maxwell relations for the system.

The following analogs are defined:

For the Gibbs Function:
$$\psi = u + \sum_{j=1}^N \vec{F}_j \cdot \vec{x}_j - Ts$$

For the Helmholtz Function:
$$\psi_q = u - Ts$$

and for enthalpy
$$\psi_w = u + \sum_{j=1}^N \vec{F}_j \cdot \vec{x}_j$$

- How many equations similar to those of part a) can we develop from the analogs? (Example:

$$\left(\frac{\partial \psi_q}{\partial T}\right)_{\vec{F}_j} = -s$$

- How many independent Maxwell relations are available?
- Derive the Maxwell relation for

$$\left(\frac{\partial \vec{F}_j}{\partial T}\right)_{\vec{x}_i, \vec{x}_j}$$

2. For a single component closed system, the Gibbs equation is written as

$$du = Tds - \sum_{j=1}^N \vec{F}_j \cdot d\vec{x}_j$$
