Identification of Sedge and Sedge-Like Weeds in Florida Citrus

Stephen H. Futch and David W. Hall

Sedges are annual or mostly perennial grass-like plants with aerial flower-bearing stems. In annual forms, the stem is solitary to mostly several with basal leaves. Perennial forms have a thick rootstock or an erect to horizontal underground rhizome usually with shortened internodes.

Sedges usually have triangular stems with leaves arranged in groups of three and are similar to grasses in many attributes. Sedge species may be found in a wide range of conditions, ranging from very wet to dry and in many soil types.

In sedges, as well as grasses, the seed head will be produced at the end of an aerial, erect stem. This three-sided stem is usually solitary and will be tufted with basal leaves. Root systems are fibrous, including species such as yellow and purple nutsedge which produce rhizomes and tubers. Flowers are extremely small and numerous and arranged in spikelets atop the stem.

Sedges are of little economic value to man but can be very competitive with the desired crop for water, nutrients and space.

Sedges

Yellow Nut Sedge – *Cyperus esculentus* (Fig. 1)

**Season:** rapidly spreading, aggressive, erect perennial

**Stem:** slender, smooth, pithy and 3-angled (triangular in cross section), arising from rhizomes, tubers or basal bulbs

**Height:** up to 24 inches tall

**Roots:** fibrous, branched, with tubers on rhizomes

**Leaf blade:** yellowish green, prominent midvein, flat or slightly corrugated, 0.2 to 0.5 inch wide, waxy or shiny appearance, 3-ranked and growing from basal bulb, leaves usually as long or longer than flowering stem, blade tapering to long thin tip

Identification of Sedge and Sedge-Like Weeds in Florida Citrus

Figure 1. Yellow Nut Sedge

Seed head:
short, subtending leaf-like bracts, flattened, yellowish-brown spikelets, clustered around the ends of a few to 10 branches of unequal length

Propagated by:
seeds, creeping rootstock (rhizomes), or small underground nutlets. Nutlets (tubers) are brown, round, lack hairs, 0.5 to 0.75 inch long and may lie dormant in soil several years. Nutlets are individually produced and sweet or neutral to taste.

Comments:
prefers moist to dry cultivated soils and does not tolerate shade

Purple Nut Sedge – Cyperus rotundus (Fig. 2)

Season:
rapidly spreading, aggressive, erect perennial

Stem:
erect, smooth, solid, triangular in cross section, arising from tuber or basal bulb, and usually longer than leaves

Height:
up to 1.5 feet high

Roots:
extensively branched, fibrous, with tubers on rhizomes

Leaf blade:
deep-green, originates from the base of the plant, 3-ranked and grass-like, flat or slightly corrugated, prominent mid vein, 1/8 to 1/3 inch wide, and abruptly tapering to sharp point. Leaf is dark green, smooth, shiny, and usually shorter than stem.

Seed head:
short subtending leaf-like bracts, numerous, flattened, red to purple brown spikelets clustered at the end of the stalk on a few to several branches

Propagated by:
slender creeping rootstocks (rhizomes) and nutlets (tubers). Nutlets are covered with hairs and are bitter to the taste. Multiple nutlets are produced forming a tuber chain.

Archival copy: for current recommendations see http://edis.ifas.ufl.edu or your local extension office.
Comments:

thrives in moist sandy soils but does not tolerate shade, often thought to be the world’s worst weed

**Green Kyllinga – Kyllinga brevifolia**
* (Cyperus brevifolius) (Fig. 3)

![Figure 3. Green Kyllinga](image)

**Season:**
mat-forming perennial

**Stem:**
dark green, arising from purple rhizomes, with 3 subtending leaves on the end of the flower stalk

**Height:**
up to 18 inches tall, frequently about 6 inches tall

**Roots:**
fibrous

**Leaf blade:**
dark green, 1 to 5 inches long and narrow

**Flower stalk:**
triangular in cross section

**Seed head:**
subtended by a few leaf-like bracts, usually one, occasionally 2 or 3 heads, initially pale green and often turning brown at maturity, globe-shaped and 1/4 inch in diameter

**Seed:**
oval, flat in cross section (1/16 inch long)

Propagated by:
seeds and rhizomes

Comments:
found in low areas where moisture is excessive, can form large mats

**Annual Sedge, Watergrass – Cyperus compressus** (Fig. 4)

![Figure 4. Annual Sedge, Watergrass](image)

**Season:**
annual

**Stem:**
green, smooth

**Height:**
4 to 18 inches tall

**Roots:**
reddish, fibrous, extensively branching, lacks rhizomes

**Leaf blade:**
basal, 3-ranked, elongated and narrow (0.1 inch wide) and usually equal to or shorter than stem

**Seed head:**
few to several, flat, greenish, spikelets at end of stem

**Seed:**
dull brown, 3-sided, 1/16 inch long at maturity

Archival copy: for current recommendations see [http://edis.ifas.ufl.edu](http://edis.ifas.ufl.edu) or your local extension office.
Propagated by: 
  seeds

Comments: 
  found in sandy, moist soils, can form large tangled masses

**Cylindric Sedge – *Cyperus retrorsus* (Fig. 5)**

- **Season:** erect perennial
- **Stem:** densely tufted
- **Height:** up to 20 inches tall
- **Roots:** fibrous, may form short rhizomes

![Figure 5. Cylindric Sedge](image)

**Leaf blade:**
  bright green, flat, smooth

**Seed head:**
  with 3-7 leaf-like bracts at top of stem, few to several branches of tight cylindrical clustered spikelets, green and turning brown to black at maturity

**Propagated by:**
  seeds and the very short rhizomes

**Comments:**
  grass-like, occurs in most sandy habitats, extremely common

**Globe Sedge – *Cyperus croceus* (** *Cyperus globulosus** **) (Fig. 6)**

- **Season:** perennial
- **Stem:** densely tufted

  Almost identical to Cylindric Sedge. Differs in that the seed heads are globular instead of cylindrical.

- **Seed head:**
  - few to several branches of tight cylindrical clustered spikelets, green and turning brown to black at maturity

- **Propagated by:**
  - seeds and the very short rhizomes

- **Comments:**
  - grass-like, occurs in most sandy habitats, extremely common

![Figure 6. Globe Sedge](image)
Identification of Sedge and Sedge-Like Weeds in Florida Citrus

**Height:**
up to 20 inches tall

**Roots:**
fibrous, may form short rhizomes

**Leaf blade:**
bright green, flat, smooth

**Seed head:**
with 3-7 leaf-like bracts at top of stem, few to several branches of tight globular clustered spikelets, green and turning brown to black at maturity

**Propagated by:**
seeds and very short rhizomes

**Comments:**
grass-like, occurs in dry to moist sandy habitats, extremely common

**Surinam Sedge – *Cyperus surinamensis***
(Fig. 7)

![Surinam Sedge](image)

**Season:**
perennial

**Stem:**
erect, triangular with rounded edges, covered with downward curving prickles

**Height:**
up to 3 feet tall

**Roots:**
fibrous

**Leaf blade:**
up to 1/2 inch wide, green, flat

**Seed head:**
numerous, flattened, heads of spikelets, subtended by a few to several leaf-like bracts

**Seed:**
triangular, 1/32 inch long, tiny bump at bottom end

**Propagated by:**
seeds

**Comments:**
found in ditches and moist, wet sites, easily identified by lightly pulling fingers upward on the stem to check for the downward curving prickles

**Texas Sedge – *Cyperus polystachyos***
(Fig. 8)

**Season:**
annual

**Stem:**
erect, rounded, smooth

**Height:**
up to 20 inches tall

**Roots:**
fibrous

**Leaf blade:**
up to 1/8 inch wide, basal

Identification of Sedge and Sedge-Like Weeds in Florida Citrus

Figure 8. Texas Sedge

Seed head:
- few to many branches, many flattened spikelets, clustered at ends of branches

Seed:
- weakly triangular, 1/32 inch long, covered with tiny bumps, brownish-gray

Propagated by:
- seeds

Comments:
- extremely common, a facultative species growing in all dry and wet soils

Sedge-Like Weeds

Doveweed – *Murdannia nudiflora* (Fig. 9)

Season:
- warm season annual

Stem:
- fleshy, creeping

Height:
- up to 12 inches tall

Roots:
- fibrous, rooting at nodes

Leaf blade:
- fleshy, alternate, narrow, lanced-shaped

Leaf sheath:
- soft hairs on upper margin

Flower:
- blue to purple, 1/4-1/2 inch wide, in open clusters

Propagated by:
- seeds

Comments:
- usually found in moist areas, can be very prolific, often spread by birds

Common Spiderwort, Spiderwort – *Tradescantia ohiensis* (Fig. 10)

Season:
- perennial

Stem:
- smooth

Archival copy: for current recommendations see http://edis.ifas.ufl.edu or your local extension office.
Figure 10. Common Spiderwort, Spiderwort Credits: Photo provided by David Drew.

**Height:**
up to 30 inches tall

**Roots:**
fibrous

**Leaf blade:**
smooth, linear or lanceolate, folded lengthwise, fleshy

**Leaf sheath:**
smooth

**Flower:**
3/4-1 inch wide, blue, 3 petals, in umbel-like clusters, clusters subtended by 1-3 leaf-like bracts, flowers throughout the year

**Propagated by:**
seeds

**Comments:**
prefers moist areas, often forms large clumps with numerous stems

**Tropical Spiderwort, Tropical Dayflower – Commelina benghalensis** (Fig. 11)

**Season:**
 perennial

---

Figure 11. Tropical Spiderwort, Tropical Dayflower

**Stem:**
fleshy, rooting at nodes, some branching underground

**Height:**
up to 10 inches tall

**Roots:**
fibrous

**Leaf blade:**
somewhat fleshy, oval, margins wavy

**Leaf sheath:**
classing stem

**Flower:**
1/8 inch wide, two bright blue and one pale blue petals, subtended by a boat-shaped bract that has the basal margins united; underground branches have flowers that do not open and produce fruit

**Propagated by:**
seeds from both above and underground flowers

**Comments:**
a rapidly expanding weed, not well known, quite common in open sandy areas
