

Basic Reptile Care

- Adequate space and ventilation
- Clean, safe substrate and clean water
- Quality UV lighting (not needed for snakes)
- Vitamin and mineral supplements

Snakes

- Secure lid latches/clips prevent escape.
- Appropriate environment—each species has its own requirements. Most of the species recommended here can be kept at room temperature, but their enclosures should provide cooler and warmer spots. Adequate humidity is also important for some species.
- Dietary requirements vary depending on the snake species, but most can be fed thawed, pre-killed rodents.

Lizards

- Basking areas or perches (with heat/UV source) are needed for some species.
- Dietary requirements vary greatly among species, depending on whether they are herbivores, omnivores, insectivores, or carnivores. It is important to offer a wide variety of food.

Tortoises/Aquatic Turtles

- Adequate space and shelter are essential for tortoise enclosures.
- Aquatic turtles need clean water.
- Appropriate environment is critical; pay close attention to temperature and humidity to prevent respiratory infections and other illnesses!
- Dietary and UV lighting needs should **not** be underestimated. Tortoises require a variety of fresh, nutrient-rich fruits and vegetables, not just lettuce!

Make sure your pet reptile is captive born and bred.* This will:

- Ensure that your pet was not removed from a wild population (including eggs).
- Ensure that your pet will not have a lot of parasites in or on its body.

*Ask the breeder or pet shop questions about where and how the animal was bred.

Learn your local captive wildlife laws!

Many states have laws dealing with wild and captive (native and non-native) reptiles. These laws range from space and permit requirements to prohibited species—some states don't even allow reptiles to be kept as pets! To learn more about your local laws regarding captive wildlife, visit:

www.fishwildlife.org/where_us.html

It is NEVER legal to release non-native wildlife!

Buyers' Guide to Pet Reptiles

Cornsnake

When choosing a pet reptile, you should consider:

- How long will this animal live?
- How large will this animal grow?
- How much will it cost to feed and care for this animal?
- What are the long-term requirements for this animal?
- Where did this animal come from?
- Will this animal be a safe pet for my household?

Burmese Python

These are usually good pets, because...

Cornsnake, Ratsnake, Milksnake, Kingsnake

These snakes are readily available through local breeders/pet shops and are usually captive bred. They generally have a good temperament and basic care requirements.

Ball Python

This species of python is very popular and readily available in a variety of color patterns. The Ball Python is probably the best pet python (especially for beginners) because of its smaller size and minimal caging requirements. However, you should know that these snakes can live for 20-30 years.

Leopard Gecko, Bearded Dragon, Blue-tongued Skink

These lizards are available through local breeders or pet shops and are all small to medium-sized species with good temperaments and basic care requirements. Leopard geckos are especially easy to care for because, unlike other lizards, they do not require UV lights.

Red-footed Tortoise, Yellow-footed Tortoise

These tortoises are readily available at pet stores, have great temperaments, and are among the best choices for a pet turtle. However, tortoises require a large enclosure, and all species need quality UV lighting and a nutritious diet including a variety of fresh fruits and vegetables. Be aware that these species can live for 25-60 years.

CAUTION! These may be poor pets, because...

Burmese, Reticulated, and African Pythons, Anacondas

Although they are readily available and are often inexpensive, these snakes can grow to over 20 feet long and can be dangerous. In Florida, the sale and possession of these species is now restricted by law.

Most Monitor Lizards

Monitor lizards are often readily available but some species can be dangerous to handle. They also have extensive care requirements and need very large enclosures with quality UV lighting/exposure.

Green Iguana

Iguanas are readily available and are inexpensive but grow quite large and become aggressive as adults—as a result, finding new homes for unwanted iguanas is nearly impossible. They are prone to health problems if not fed a nutritious, varied diet, and require large enclosures with UV lighting.

African Spurred Tortoise (aka Spur-Thigh or Sulcata Tortoise)

This species of tortoise is widely available at small sizes, but can grow to weigh over 200 pounds! Most tortoises do not make good pets for beginners, because they are very long-lived and many need large enclosures with carefully regulated heat and humidity.

Slider & Softshell Turtles

These aquatic turtles require large enclosures with filtered water (or frequent water changes) and UV lighting. In Florida, the sale and possession of invasive red-eared slider turtles is now restricted by law, although they are sometimes sold illegally.
