

Handbook of Florida Water Regulation: Solid Waste Management¹

Michael T. Olexa and Zachary Broome²

Preface

This handbook is designed to provide an accurate, current, and authoritative summary of the principal federal and state (Florida) laws that directly or indirectly relate to agriculture. This handbook provides a basic overview of the many rights and responsibilities that farmers and farmland owners have under both federal and state laws as well as the appropriate contact information to obtain more detailed information. However, the reader should be aware that because the laws, administrative rulings, and court decisions on which this handbook is based are subject to constant revision, portions of this publication could become outdated at any time. Several details of cited laws are also left out due to space limitations.

This handbook is distributed with the understanding that the authors are not engaged in rendering legal or other professional advice, and the information contained herein should not be regarded as a substitute for professional advice. This handbook is not all inclusive in providing information to achieve compliance with the federal and state laws and regulations governing water protection. For these reasons, the use of these materials by any person constitutes an agreement to hold harmless the authors, the Florida Cooperative Extension Service, the Institute of Food and Agricultural Sciences, and the University of Florida for any liability claims, damages, or expenses that

may be incurred by any person as a result of reference to or reliance on the information contained in this handbook.

Who Regulates Solid Waste Management?

Both federal and state governments have enacted Resource Conservation and Recovery Act (RCRA) legislation to deal with the disposal of solid wastes. The federal rules are administered by the United States Environmental Protection Agency (EPA) and the state rules are administered by the Florida Department of Environmental Protection (FDEP).

Both federal and state RCRA are aimed at protecting public health and the environment and at recycling or reclaiming solid wastes to the greatest extent practicable. Because improperly handled solid waste (e.g., residues generated during the treatment of domestic wastewater, or used oil) represents such a grave threat to water quality, it also falls within the scope of other federal regulations, most notably the National Pollutant Discharge Elimination System (NPDES) of the Federal Clean Water Act. NPDES is an EPA- and state-enforced system requiring permits for all point source pollution discharges into navigable waters (see [FE602](#), Groundwater Discharge Regulation at the Federal Level; the broad definition of “navigable waters” is covered in [FE582](#), Clean Water Act). Under the Clean

This is EDIS document FE611, a publication of the Food and Resource Economics Department, Florida Cooperative Extension Service, Institute of Food and Agricultural Sciences, University of Florida, Gainesville, FL. Published December 2005, revised June 2011. Please visit the EDIS website at <http://edis.ifas.ufl.edu>.
2. Michael T. Olexa, professor, Food and Resource Economics Department, and director, Agricultural Law Center, University of Florida, Florida Cooperative Extension Service, Institute of Food and Agricultural Sciences, University of Florida, Gainesville, FL, and chair, Agricultural Law Committee, The Florida Bar, and Zachary Broome, student, Levin College of Law, University of Florida, Gainesville, FL 32611.

Water Act, Confined Animal Feeding Operations (CAFO) are considered a point source, requiring an NPDES permit before they are allowed to operate.

Aside from the areas of special state and federal interest, local authorities are basically free to set their own rules, within broad state guidelines, for the collection and disposal of solid wastes. Cities, counties, and municipalities should be consulted regarding problems involving the locations of disposal facilities, frequency of waste pickup, and other day-to-day waste disposal questions.

What Is Solid Waste?

Solid waste is defined in two categories: (1) any garbage, refuse, sludge, or other discarded material and (2) any liquid, semi-solid, or contained gaseous material. Furthermore, waste from agricultural activities is expressly included in the definition of solid wastes.

The only relevant materials that are explicitly listed as *not* within the RCRA definition of solid waste are as follows:

- Solid or dissolved materials in domestic sewage
- Solid or dissolved waste from irrigation return flows
- Industrial discharges from point sources which are permitted for release under NPDES of the Clean Water Act
- Source, special nuclear, or byproduct material as defined by the Atomic Energy Act of 1954

If none of these exceptions apply, and if the material involved may be said to be discarded or to have served its useful purpose, it is a solid waste. Solid waste may be recycled, reused, discarded, reclaimed, or stored, depending on its nature. Many solid wastes may also be hazardous wastes and subject to other, more restrictive regulations. Therefore the section on hazardous waste ([FE612](#)) must also be consulted when considering solid wastes.

NPDES coverage extends only to discharges into navigable waters and sets different standards for the amount of waste that may be discharged based on:

- The type of industry involved
- The toxicity of the waste

- The acceptable maximum amounts of harmful elements which can be released into the body of water that is being polluted

Facilities that dispose of wastes in any way not in accordance with the federal RCRA guidelines or NPDES requirements for discharging water are deemed to be violators of the law.

What Are Residuals?

FDEP has established detailed regulations controlling the application of residuals (sludge) to land. Residuals are solid, liquid, or semi-solid residues generated during the treatment of domestic wastewater in a domestic wastewater treatment facility. Residuals can be applied to land only if the facility generating or treating the residuals has a valid permit that includes an approved Agricultural Use Plan for the application site. Residuals are classified as either Class A or Class B with respect to the pathogen reduction requirements set forth by EPA as follows:

- Class A residuals are allowed on unrestricted public areas, such as playgrounds, parks, golf courses, lawns, and hospital grounds.
- Class B residuals are only allowed on restricted public access areas, such as agricultural sites, forests, and roadway shoulders and medians. The public shall be restricted from the application zone for twelve months after the last application of the residuals. Additional restrictions apply when residuals are applied to soil in which food crops are grown and harvested and where animals graze on the application site.

Cautions that apply to the use or disposal of residuals include the following:

- Residuals may never be dumped into oceans, or ground or surface waters
- Residuals must not be discharged into a collection or transmission system without prior consent of the owner of that system
- Residuals containing hazardous wastes may never be applied to agricultural lands, and may require disposal under more restrictive, hazardous waste regulations

How Is Used Oil Regulated?

Both state and federal laws are consistent in their prohibitions against the haphazard disposal of used oil. It is clearly a *violation* to:

- Discharge oil into soils, sewers, drainage systems, septic tanks, ground or surface waters, watercourses, or marine waters
- Dispose of oil in a landfill, or commingle (mix) oil with other wastes for the purpose of disposing of it in a landfill
- Commingle (mix) used oil with hazardous substances that make the used oil unsuitable for recycling or beneficial use
- Release used oil into the environment through any process, including weed control, dust control, road oiling, or other similar uses

Furthermore, all processors and transporters of used oil must register with FDEP annually, and all facilities for handling used oil must obtain FDEP permits.

What Can Be Composted from Waste?

FDEP has established detailed regulations for the production and use of compost created from waste. The scope of these regulations does not encompass the use of compost obtained from normal farming operations on the land where it was generated.

Rules for when you *may* compost:

- You may compost solid wastes produced in “normal farming operations” such as activities used in the production of poultry, livestock, or agricultural crops (normal waste from these operations includes organic waste, manure, and wastes derived solely from agricultural crops)
- As long as you have obtained permits from FDEP and complied with detailed FDEP regulations, you may produce compost for sale

Rules for when you *may not* compost:

- You may not use compost from solid waste as fill material in any body of surface water
- FDEP regulations prohibit any application of compost that would endanger public health or the environment

What Should Not Go into Landfills?

Florida has taken an interest in limiting the types of solid waste to be disposed of through landfills and has specifically prohibited the use of landfills to dump:

- Used oil
- Lead-acid batteries
- Yard trash
- White goods (e.g., discarded appliances such as refrigerators or water heaters)

The burning of solid waste is also prohibited except under the conditions expressly approved by the rules for disposal facilities.
