

# Chapter 15. Root Crop Production in Florida<sup>1</sup>

Julien Beuzelin, Peter J. Dittmar, Hugh A. Smith, Bonnie Wells, Johan Desaeger, Lincoln Zotarelli, Shouan Zhang, Qingren Wang, Craig Frey, and Anna Meszaros<sup>2</sup>

## Beet, Carrot, Radish, and Sweetpotato Botany and Planting

**Beet**—*Beta vulgaris*, Chenopodiaceae

**Carrot**—*Daucus carota*, Apiaceae (Umbelliferae)

**Radish**—*Raphanus sativus*, Brassicaceae (Cruciferae)

**Sweetpotato/Boniato**—*Ipomoea batatas*, Convolvulaceae

Table 1. Planting information for beet, carrot, radish, and sweetpotato/boniato.

Planting Dates	Beet	Carrot	Radish	Sweetpotato/Boniato
North Florida	Aug–Feb	Aug–Mar	Sept–Mar	Mar–June
Central Florida	Sept–Feb	Aug–Mar	Sept–Mar	Feb–June
South Florida	Oct–Jan	Sept–Mar	Oct–Mar	Dec–Sept (orange flesh type) Year-round (boniato/batatas type)
Planting Information				
Distance between rows (in)	12–30	10–12	6	36–48
Distance between plants (in)	2–4	1–3	1	10–12
Seeding depth (in)	0.5–1.0	0.25	0.25	3–4
Seed per acre (lb)	10–15	2–4	10–20	9,000–15,000
Days to maturity from seed	50–70	70–120	20–30	85–130
Plant population (acre)	261,360	630,000	1 million+	9,000–15,000

U.S. Department of Agriculture, UF/IFAS Extension Service, University of Florida, IFAS, Florida A & M University Cooperative Extension Program, and Boards of County Commissioners Cooperating. Andra Johnson, dean for UF/IFAS Extension.

# Cultivars

Table 2. Common cultivars of beet, carrot, and sweetpotato/boniato.

Beet	Carrot	Radish	Sweetpotato/Boniato
Bohan	Apache	Diego	Beauregard
Boro	Choctaw	Escala F <sup>1</sup>	Covington
Bulls Blood (tops)	Navajo	Fuego <sup>1</sup>	Evangeline
Golden Beets (yellow)	Top Notch	Red Castle	Hernandez
Green Top		Red Pearl	Picadito (Boniato)
Pacemaker III		Red Satin F <sup>1</sup>	
Red Ace		Red Silk2	
Red Cloud		Rudi	

<sup>1</sup> Resistant to yellows; tolerant to black root and rhizoctonia scurf.  
<sup>2</sup> Resistant to pithing; intermediate resistance to black root, yellows, clubroots, rhizoctonia scurf.

## Tropical Root Crops

Tropical root crops are planted primarily for their edible roots, tubers, corms, or cormels. In this regard, tropical root crops require a longer period of time to mature than many other vegetable crops. Some root crops take as long as 14 months to reach maturity. Some people also eat the edible leaves of sweetpotato/boniato, cassava, and taro. In the case of these crops, plants grown for edible leaves can be grown in cooler locations than would otherwise be possible. For pest control products, these crops are included in root and tuber vegetables.

## Botany and Planting

Table 3. Planting information for cassava, taro, and malanga.

Planting Dates	Cassava	Taro	Malanga
Miami-Dade County	Year-round (mainly February to April)	Year-round	Year-round
Planting Information			
Distance between rows (in)	48	52	52
Distance between plants (ft)	2	1	1
Planting depth (in)	3–4	4–6	4–6
Propagules needed per acre	5,445	2,420–3,630	2,420–3,630
Minimum propagule size	10”–12” stick or micropropagules	2 oz	2 oz
Bedded	No	Yes	Yes
Months to harvest from planting	8–12	6–10	9–14
Plant populations (acre)	5,445	10,052	10,052

## Cultivars

**Cassava**—Known the world over by a variety of names, including manioc, yuca, mandioca, balinghoy, kamoteng, kahoy (Philippines), mogo (Africa), tapioca root (India), and manioc root in its native South America. Though the exact origins of cassava are unknown, it was likely domesticated between 7,000 and 9,000 years ago in the Amazon. This root crop is grown throughout the tropics and has become an important dietary staple in many parts of the world.

Varieties are often separated based of their cyanogenic glucoside (HCN) content into either low HCN, a.k.a. “sweet,” or high HCN, a.k.a. “bitter,” types. The term “bitter” comes from a bitter flavor that is commonly believed to accompany the HCN. Though no named varieties are currently known in southern Florida, ‘Senorita’ was locally popular in the 1980s, and attempts were made to introduce the CIAT variety ‘Mantiqueira’ at that time because it produced acceptable yields even with high levels of root-knot nematode infestation. The range of local genotypes covers a few unnamed clones that have been imported from various Caribbean basin countries. However, federal regulations prohibit further importation of cuttings or botanical seed.

Root development may occur as early as 28 days after planting, though it may take about six weeks before fibrous roots begin to thicken rapidly with starch granules. There does not appear to be any specific trigger to root thickening, but the number of roots that will eventually thicken is determined early in the life of the crop, with little change in the number of thickened roots after three months. A soil fertility analysis is conducted as a routine practice to ensure an adequate amount of potassium is maintained in the soil to improve root development for improved yield. The amount of nitrogen available to the crop is often limited because excessive nitrogen increases vegetative growth rather than the root development.

For people who are able to find cuttings, follow the technique developed by scientists at the International Institute for Tropical Agriculture (IITA) in Ibadan, Nigeria, where one makes 2-node cuttings, or ministakes, which can provide a 5-fold increase in the production of propagules from each parent cassava plant. According to IITA, “[t]hese ministakes are easily moved and protected in plastic sacks until they can be grown on and hardened in individual plastic bags or nursery beds before being planted in the field.”

It takes 8–12 months for cassava roots to reach maturity. Plants are often cut back two weeks prior to harvest, resulting in increased tuber size and yields about 10% higher.

Preferences for specific varieties of cassava used for edible leaves may exist among consumers, though the ability to satisfy these requests is very limited, given the very small number of varieties currently grown in the United States.

**Tannia** is widely grown and used in the tropics. It has been grown since 1963 on a limited commercial scale in south Florida, where it is typically planted in the spring because the crop requires 9 to 10 months to reach maturity and can be injured by frosts. Tannia can be propagated by several methods: (1) plant the top (head), (2) plant the whole main tuber, (3) plant pieces of the main tuber, or (4) plant individual secondary tubers. Propagative materials should be set 3 to 5 inches below the surface. ‘South Dade White’ produces white-fleshed cormels, ‘Malanga Amarilla’ produces a yellow-fleshed edible corm, and ‘Vinola’ produces purple-fleshed cormels.

**Taro**—‘Malanga Isleña’ produces one large white-fleshed central corm; a few unnamed Polynesian types are grown for the Asian market. The name taro is generally used to refer to *Colocasia esculenta*, one of several major root crops in the Araceae (Aroid) family.

There are several important crops throughout the tropical regions of the world related to taro and grown in certain Florida locations. These include the giant swamp taro, the giant taro, and cocoyam. Each of these Aroids has several other common names in different regions of the world.

Information about taro in Florida is limited due to a small acreage. However, taro can be cultivated under both wetland and dryland conditions, with the latter referred to as “dasheens” in Florida. Most will mature in 6 to 10 months, with corms being dug up with modified potato harvesters in commercial production. The corms are washed of soil, sorted by size, and packed. The recommended cold room temperature for prolonged storage is 45°F–50°F with a relative humidity of 85.

**Tropical sweetpotato or boniato**—‘Picadito’ is the main variety grown in Miami-Dade County. Sweetpotato usually has shallow-lobed leaves and wine-colored skin with orange flesh. However, boniato, which is predominantly grown in Miami-Dade County, has deeply lobed leaves and wine-colored skin with white flesh.

It is illegal to import sweetpotato/boniato into the United States due to soil pests, such as sweetpotato weevils, and there is no program to produce disease-free planting material of ‘Picadito’ in Florida. Other sweetpotato growing states have developed red-skinned, white-fleshed sweetpotatoes, which may grow well in Florida and which may be available from those plant breeders or through certified slip producers.

In regard to other tropical root crops, such as daikon radish or turmeric, readers may refer to [Chapter 5](#), “Ethnic Vegetable Production.”

The following tables list registered pesticides that should be integrated with other pest management methods. Additional information on integrated management methods can be requested from UF/IFAS Extension horticulture or agriculture agents. A list of local UF/IFAS Extension offices is available at <https://sfyl.ifas.ufl.edu/find-your-local-office/>.

**Table 4. Herbicides approved for managing weeds in beet. Contact: Peter J. Dittmar, UF/IFAS Horticultural Sciences Department.**

Active Ingredient lb a.i./A	Trade Name Product/A	MOA Code	Weeds Controlled/Remarks
<b>Labels change frequently. Be sure to read a current product label before applying any chemical.</b>			
<b>*** PREEMERGENCE ***</b>			
<b>Carfentrazone</b> up to 0.031	(Aim) 2 EC up to 2 fl oz	14	Apply as a preplant burndown for emerged broadleaf weeds. Use crop oil concentrate, methylated seed oil, or nonionic surfactant at recommended rates. Maximum rate of 0.096 lb a.i./A per season. No pretransplant interval.
<b>Glyphosate</b>	(various formulations) consult labels	9	Emerged broadleaf and grass weeds. Apply as a preplant burndown. Consult labels for individual product directions.
<b>Pelargonic acid</b>	(Scythe) 4.2 EC 3%–10% v/v	27	Emerged broadleaf and grass weeds. Apply as a preplant burndown treatment. Scythe is a contact and nonresidual herbicide and can be tank-mixed with residual preemergence herbicides to lengthen control.
<b>Pyraflufen</b> 0.001–0.003	(ET Herbicide) 0.208 EC 0.5–2.0 fl oz	14	Emerged broadleaf weeds and grass weeds. Apply as a preplant burndown treatment.
<b>*** POSTEMERGENCE ***</b>			
<b>Carfentrazone</b> up to 0.031	(Aim) 2 EC up to 2 fl oz	14	Emerged broadleaf weeds. Apply as a hooded application to row middles only. Use crop oil concentrate or nonionic surfactant at recommended rates. May be tank-mixed with other herbicides. Do not exceed 6.1 fl oz per cropping season. PHI 0 days.
<b>Clethodim</b> 0.09–0.13 0.07–0.25	(Select, Arrow) 2 EC 6–8 fl oz (Select Max) 1 EC 9–16 fl oz	1	Perennial and annual grass weeds. In fields with heavy grass pressure or larger grass weeds, use higher rates or repeat application 14 days apart. Use a crop oil concentrate at 1% v/v in the finished spray volume. Consult the label for necessary surfactant. PHI 30 days.
<b>Pelargonic acid</b>	(Scythe) 4.2 EC 3%–10% v/v	27	Emerged broadleaf and grass weeds. Direct spray to row middles. Product is a contact, nonselective, foliar-applied herbicide with no residual control. May be tank-mixed with several soil residual compounds.
<b>Sethoxydim</b> 0.28–0.47	(Poast) 1.5 EC 1.5–2.5 pt	1	Emerged grass weeds. A maximum of 5 pt/A applied in one season. Include a crop oil concentrate. Unsatisfactory results may occur if applied to grasses under stress. PHI 60 days.
<b>S-metolachlor</b>	(Dual Magnum) 7.62 EC	15	Grass and broadleaf weeds and nutsedge. Label is a Third-Party Registration (TPR, Inc.). Use without a signed authorization and waiver of liability is a misuse of the product.

Table 5. Herbicides approved for managing weeds in carrot. Contact: Peter J. Dittmar, UF/IFAS Horticultural Sciences Department.

Active Ingredient lb a.i./A	Trade Name Product/A	MOA Code	Weeds Controlled/Remarks
<b>Labels change frequently. Be sure to read a current product label before applying any chemical.</b>			
<b>*** PREEMERGENCE ***</b>			
<b>Carfentrazone</b> up to 0.031	(Aim) 2.0 EC up to 2 fl oz	14	Apply as a preplant burndown for emerged broadleaf weeds. Use crop oil concentrate, methylated seed oil, or nonionic surfactant at recommended rates. Maximum rate of 0.096 lb a.i./A per season. No pretransplant interval.
<b>Glyphosate</b>	(various formulations) consult labels	9	Emerged broadleaf and grass weeds. Apply as a preplant burndown. Consult label for individual product directions.
<b>Linuron</b> 0.5–1.0	(Lorox DF) 50 DF 1–2 lb	7	A single application after planting and before crop emergence. Plant seed at least 0.5 in. deep. Preemergence and postemergence application should not exceed 4 lb/A per season.
<b>Paraquat</b> 0.5–1.0	(Gramoxone) 2 SL 2.0–4.0 pt (Firestorm) 3 SL 1.3–2.7 pt	22	Emerged broadleaf and grass weeds. Apply as a preplant burndown treatment. Apply before crop emergence. Use a nonionic surfactant.
<b>Pelargonic acid</b>	(Scythe) 4.2 EC 3%–10% v/v	27	Emerged broadleaf and grass weeds. Apply as a preplant burndown treatment. Scythe is a contact and nonresidual herbicide and can be tank-mixed with a residual preemergence herbicide to lengthen time of control.
<b>Pendimethalin</b> 0.95	(Prowl H2O) 3.8 2.0 pt	3	Broadleaf and grass control. Apply within 2 days of planting before the emergence of the crop. PHI 60 days.
<b>Prometryn</b> 1.0–2.0	(Caparol) 4 L 2–4 pt	5	Most annual broadleaf and grass weeds. Do not exceed one application. Consult label for rotational crop restrictions.
<b>Pyraflufen</b> 0.001–0.003	(ET Herbicide) 0.208 EC 0.5–2.0 fl oz	14	Emerged broadleaf and grass weeds. Apply as a preplant burndown treatment.
<b>Trifluralin</b> 0.5	(Treflan, Trifluralin) 4 EC 1 pt (Treflan TR-10) 5 lb	3	Annual broadleaf and grass weeds. Do not apply to muck soils. Mineral soils with 2%–5% organic material, apply 0.75 lb a.i./A. Incorporate 4 inches or less with 8 hr of application. PHI 60 days.
<b>***POSTEMERGENCE***</b>			
<b>Carfentrazone</b> Up to 0.031	(Aim) 2.0 EC up to 2 fl oz	14	Emerged broadleaf weeds. Apply as hooded application to row middles only. Use crop oil concentrate or nonionic surfactant at recommended rate. May be tank-mixed with other herbicides. Do not exceed 6.1 fl oz per cropping season. PHI 0 days.
<b>Clethodim</b> 0.09–0.13 0.07–0.13	(select, Arrow) 2 EC 6–8 fl oz (Select max) 1 EC 9–16 fl oz	1	Perennial and annual grass weeds. In fields with heavy grass pressure or larger grass weeds, use higher rates or repeat applications 14 days apart. Use a crop oil concentrate at 1% v/v in the finished spray volume. Nonionic surfactant with Select Max. PHI 30 days
<b>Fluazifop</b> 0.188	(Fusilade DX) 2 EC 12 fl oz	1	Actively growing grass weeds. Maximum is 48 fl oz/A per growing season. Withhold field flooding 45 to 60 days following application. In Palm Beach and Hendry Counties a 60-day interval must be observed for flooding. PHI 45 days.
<b>Linuron</b> 0.5–1.0	(Lorox DF) 50 DF 1–2 lb	7	Apply after carrots are 3 inches tall. Repeat applications may be made but do not exceed 4 lb/A. Can be applied following Stoddard Solvent provided that the applications are at least one day apart. Do not tank-mix with Stoddard Solvent.
<b>Metribuzin</b> 0.25	(Metribuzin, Metri, Tricor) 75 DF 0.3 lb (Metri, Tricor) 4 F 0.5 pt	5	Broadleaf and grass control. Total amount applied in a season should not exceed 0.5 lb a.i./A. Apply after carrots have 5–6 true leaves and weeds are less than 1 in. in height. If needed, a second application may be made after an interval of at least 3 wk. PHI 60 days.
<b>Pelargonic acid</b>	(Scythe) 4.2 EC 3%–10% v/v	27	Emerged broadleaf and grass weeds. Direct spray to row middles. Product is a contact, nonselective, foliar-applied herbicide with no residual control. May be tank-mixed with several soil residual compounds.
<b>Prometryn</b> 1.0–2.0	(Caparol) 4 L 2–4 pt	5	Most annual broadleaf and grass weeds. Apply up to 6-leaf stage of carrot. One application of 4 pt/A or two applications of 2 pt/A. For POST control of weeds, include NIS or COC. Consult label for rotational crop restrictions. PHI 30 days.

Active Ingredient lb a.i./A	Trade Name Product/A	MOA Code	Weeds Controlled/Remarks
<b>Sethoxydim</b> 0.28–0.38	(Poast) 1.5 EC 1.5–2.0 pt	1	Emerged grass weeds. A maximum of 5 pt/A applied in one season. Include a crop oil concentrate. Unsatisfactory results may occur if applied to grasses under stress. PHI 30 days.
<b>S-metolachlor</b>	(Dual Magnum) 7.62 EC	15	Grass and broadleaf weeds and nutsedge. Label is a Third-Party Registration (TPR, Inc.). Use without a signed authorization and waiver of liability is a misuse of the product.

<b>Labels change frequently. Be sure to read a current product label before applying any chemical.</b>			
<b>***PREPLANT/PREEMERGENCE***</b>			
<b>Carfentrazone</b> up to 0.031	(Aim) 2.0 EC up to 2 fl oz	14	Apply as a preplant burndown for emerged broadleaf weeds. Use crop oil concentrate, methylated seed oil, or nonionic surfactant at recommended rates. Maximum rate of 0.096 lb a.i./A per season. No pretransplant interval.
<b>Glyphosate</b>	(various formulation) consult labels	9	Emerged broadleaf and grass weeds. Apply as a preplant burndown. Consult label for individual product directions.
<b>Pelargonic acid</b>	(Scythe) 4.2 EC 3%–10% v/v	27	Emerged broadleaf and grass weeds. Apply as a preplant burndown before planting.
<b>Pyraflufen</b> 0.001–0.003	(ET Herbicide) 0.208 EC 0.5–2.0 fl oz	14	Emerged broadleaf weeds. Apply as a preplant burndown treatment.
<b>S-metolachlor</b>	(Dual Magnum) 7.62 EC	15	Grass, broadleaf weeds, and nutsedge. Label is a Third-Party Registration (TPR, Inc.). Use without a signed authorization and waiver of liability is a misuse of the product.
<b>Trifluralin</b> 0.5–0.75	(Treflan HFP, Trifluralin, Trilin) 4 EC 1.0–1.5 pt (Treflan) 4 L 1.0–1.5 pt	3	Annual broadleaf and grass weeds. Incorporate or irrigate 4 in. within 8 hr. Results in Florida are erratic on soils with low organic matter and clay contents.
<b>***POSTEMERGENCE***</b>			
<b>Clethodim</b> 0.09–0.13 0.07–0.13	(Select, Arrow) 2 EC 6–8 fl oz (Select Max) 1 EC 9–16 fl oz	1	Emerged annual and perennial grass weeds. For repeat application, minimum of 14 days between applications. Do not exceed 0.25 lb a.i./A per season PHI 15 days.
<b>Sethoxydim</b> 0.47	(Poast) 1.5 EC 2.5 pt	1	Emerged grass weeds. Do not exceed 3.0 pt/A per season. Include a crop oil concentrate. Head lettuce and radicchio PHI 30 days. Leaf lettuce and endive PHI 15 days.

Table 7. Herbicides approved for managing weeds in sweetpotato. Contact: Peter J. Dittmar, UF/IFAS Horticultural Sciences Department.

Active Ingredient lb a.i./A	Trade Name Product/A	MOA Code	Weeds Controlled/Remarks
<b>Labels change frequently. Be sure to read a current product label before applying any chemical.</b>			
<b>*** PRETRANSPLANT ***</b>			
<b>Carfentrazone</b> up to 0.031	(Aim) 2 EC up to 2 fl oz	14	Apply as a preplant burndown for emerged broadleaf weeds. Use crop oil concentrate, methylated seed oil, or nonionic surfactant at recommended rates. Maximum rate of 0.096 lb a.i./A per season. No pretransplant interval.
<b>Clomazone</b> 0.49–0.75	(Command) 3 ME 1.3–2.0 pt	13	Annual broadleaf and grass weeds. Use lower rates on coarse soils. Apply within 5 days of transplanting.
<b>DCPA</b> 4.5–6.0	(Dacthal) W-75 6.0–8.0 lb (Dacthal) 6 F 6.0–8.0 pt	3	Annual broadleaf and grass weeds. Apply immediately after transplanting. May be applied as a layby later in the season for preemergence control.
<b>Flumioxazin</b> 0.096	(Valor) 51 WDG 3 oz	14	Annual broadleaf weeds. Do not use transplants that were harvested 2 days before application. Severe injury occurs if applied after transplanting. Apply 2–5 days before transplanting, and minimize soil disturbance after application.
<b>Glyphosate</b>	(various formulations) consult labels	9	Emerged broadleaf and grass weeds. Apply as a preplant burndown. Consult labels for individual product directions.
<b>Napropamide</b> 1.0–2.0	(Devrinol DF XT) 50 DF 2.0–4.0 lb	15	Annual broadleaf and grass weeds. Apply immediately after transplanting. If rainfall does not occur within 24 hr after application, then incorporate or irrigate 2–4 in. deep.
<b>Pelargonic acid</b>	(Scythe) 4.2 EC 3%–10% v/v	27	Emerged broadleaf and grass weeds. Apply as a preplant burndown treatment. Scythe is a contact and nonresidual herbicide and can be tank-mixed with residual preemergence herbicides to lengthen control.
<b>Pyraflufen</b> 0.001–0.003	(ET Herbicide) 0.208 EC 0.5–2.0 fl oz	14	Emerged broadleaf weeds and grass weeds. Apply as a preplant burndown treatment.
<b>*** POSTTRANSPLANT ***</b>			
<b>Carfentrazone</b> up to 0.031	(Aim) 2 EC up to 2 fl oz	14	Emerged broadleaf weeds. Apply as a hooded application to row middles only. Use crop oil concentrate or nonionic surfactant at recommended rates. May be tank-mixed with other herbicides. Do not exceed 6.1 fl oz per cropping season. PHI 0 days.
<b>Clethodim</b> 0.09–0.25 0.07–0.25	(Select, Arrow) 2 EC 6–16 fl oz (Select Max) 1 EC 9–16	1	Perennial and annual grass weeds. In fields with heavy grass pressure or larger grass weeds, use higher rates or repeat application 14 days apart. Consult the label for the necessary surfactant. PHI 30 days.
<b>Pelargonic acid</b>	(Scythe) 4.2 EC 3%–10% v/v	27	Emerged broadleaf and grass weeds. Direct spray to row middles. Product is a contact, nonselective, foliar-applied herbicide with no residual control. May be tank-mixed with several soil residual compounds.
<b>Sethoxydim</b> 0.28–0.47	(Poast) 1.5 EC 1.5–2.5 pt	1	Emerged grass weeds. A maximum of 5 pt/A applied in one season. Include a crop oil concentrate. Unsatisfactory results may occur if applied to grasses under stress. PHI 60 days.

<sup>1</sup> Mode of Action (MOA) codes for plant pest insecticides from the Insecticide Resistance Action Committee (IRAC) Mode of Action Classification v. 10.2, March 2022. Number codes (1 through 29) are used to distinguish the main insecticide mode of action groups, with additional letters for certain subgroups within each main group. All insecticides within the same group (with the same number) indicate the same active ingredient or a similar mode of action. This information must be considered for the insecticide resistance management decisions. - = unknown, or a mode of action that has not been classified yet.

<sup>2</sup> Information provided in this table applies only to Florida. Be sure to read a current product label before applying any product. The use of brand names and any mention or listing of commercial products or services in the publication does not imply endorsement by UF/IFAS Extension nor discrimination against similar products or services not mentioned. OMRI-listed: Listed by the Organic Materials Review Institute for use in organic production.

**\*Restricted use insecticide.**

<sup>1</sup> Mode of Action (MOA) codes for plant pest insecticides from the Insecticide Resistance Action Committee (IRAC) Mode of Action Classification v. 10.2, March 2022. Number codes (1 through 29) are used to distinguish the main insecticide mode of action groups, with additional letters for certain subgroups within each main group. All insecticides within the same group (with the same number) indicate the same active ingredient or a similar mode of action. This information must be considered for the insecticide resistance management decisions. - = unknown, or a mode of action that has not been classified yet.

<sup>2</sup> Information provided in this table applies only to Florida. Be sure to read a current product label before applying any product. The use of brand names and any mention or listing of commercial products or services in the publication does not imply endorsement by UF/IFAS Extension nor discrimination against similar products or services not mentioned. OMRI-listed: Listed by the Organic Materials Review Institute for use in organic production.

**\*Restricted use insecticide.**

Table 10. Insecticides labeled for management of arthropod pests of sweetpotato. Contact: Julien Beuzelin, UF/IFAS Everglades Research and Education Center.

Insects	MOA Code <sup>1</sup>	Trade Name (Active Ingredient) *Restricted	Rate (Product/Acre)	REI (Hours)	Days to Harvest	Notes <sup>2</sup>
<b>Labels change frequently. Be sure to read a current product label before applying any chemical. Please refer to Chapter 19 for information on biopesticides, including materials labeled for certified organic production.</b>						
<b>Aphids</b>	3A	<b>*Fastac CS</b> (alpha-cypermethrin)	3.2–3.8 fl oz	12	1	Maximum of 11.4 fl oz/acre per season.
	3A	<b>*Mustang Maxx</b> (zeta-cypermethrin)	3.2–4.0 fl oz	12	1	Maximum of 24 fl oz/acre per season. Leaves cannot be used for food or feed.
	3A	<b>*Warrior II</b> (lambda-cyhalothrin)	1.28–1.92 fl oz	24	7	Maximum of 7.68 fl oz/acre per crop. Many other brands with same active ingredient are available.
	3A + 28	<b>*Besiege</b> (lambda-cyhalothrin + chlorantraniliprole)	5–9 oz	24	14	Do not apply more than 27.0 fl oz of product per acre per season.
	4A	<b>Actara</b> (thiamethoxam)	1.5–3.0 oz	12	14	Do not use after Platinum.
	4A	<b>Admire Pro</b> (imidacloprid)	<b>Soil:</b> 4.4–10.5 fl oz <b>Foliar:</b> 1.2 fl oz	12	<b>Soil:</b> 125 <b>Foliar:</b> 7	One application to soil per season. If using as a foliar spray, no more than 3.7 fl oz per acre per season.
	4A	<b>Assail 30SG</b> (acetamiprid)	1.5–4.0 oz	12	7	Whiteflies not on label for sweetpotatoes but are for other crops on label. No more than 4 applications per season.
	4A	<b>Belay</b> (clothianidin)	<b>In-furrow or side-dress:</b> 9–12 fl oz <b>Foliar:</b> 2–3 fl oz	12	<b>Foliar:</b> 14	In-furrow or side-dress application, including chemigation up to 50% ground cover. Do not apply more than 12 fl oz per acre per year.
	4A	<b>Platinum 75SG</b> (thiamethoxam)	1.66–2.67 oz	12	Applied at planting	To manage resistance, avoid using other Group 4A insecticides in conjunction with Platinum.
	4C	<b>Transform WG</b> (sulfoxaflor)	<b>Leaf production:</b> 0.75–1.0 oz <b>Root production:</b> 0.75–1.5 oz	24	7	Maximum of 8.5 oz/acre per year.
	4D	<b>Sivanto Prime</b> (flupyradifurone)	7–14 fl oz	4	7	Minimum interval between applications = 7 days. Maximum allowed per acre per year = 28 fl oz.
	9B	<b>Fulfill</b> (pymetrozine)	2.75–5.5 oz	12	14	Allow a minimum of 7 days between applications. Do not exceed 11 oz/acre per season.
	9B	<b>PQZ</b> (pyrifluquinazon)	2.4–3.2 fl oz	12	7	7 days before reapplication. Maximum of 9.6 fl oz rate per season.

Insects	MOA Code <sup>1</sup>	Trade Name (Active Ingredient) *Restricted	Rate (Product/Acre)	REI (Hours)	Days to Harvest	Notes <sup>2</sup>
	23	<b>Movento</b> (spirotetramat)	4.0–5.0 fl oz	24	7	Maximum of 10 fl oz/acre per season.
	28	<b>Verimark</b> (cyantraniliprole)	6.75–13.5 fl oz	4	At planting	Maximum of 0.4 lb a.i./acre per year of cyantraniliprole, including all application types.
	29	<b>Beleaf 50 SG</b> (flonicamid)	2.0–2.8 oz	12	7	Do not apply more than 8.4 oz per acre per season.

<sup>1</sup> Mode of Action (MOA) codes for plant pest insecticides from the Insecticide Resistance Action Committee (IRAC) Mode of Action Classification v. 10.2, March 2022. Number codes (1 through 29) are used to distinguish the main insecticide mode of action groups, with additional letters for certain subgroups within each main group. All insecticides within the same group (with the same number) indicate the same active ingredient or a similar mode of action. This information must be considered for the insecticide resistance management decisions. - = unknown, or a mode of action that has not been classified yet.

<sup>2</sup> Information provided in this table applies only to Florida. Be sure to read a current product label before applying any product. The use of brand names and any mention or listing of commercial products or services in the publication does not imply endorsement by UF/IFAS Extension nor discrimination against similar products or services not mentioned. OMRI-listed: Listed by the Organic Materials Review Institute for use in organic production.

**\*Restricted use insecticide.**

Table 11. Beet fungicides ordered by disease and then FRAC group according to their mode of action. Contact: Shouan Zhang, UF/IFAS Tropical Research and Education Center.

<sup>1</sup> FRAC code (fungicide group): Number (1 through 45) and letters (U and P) are used to distinguish the fungicide mode of action groups. All fungicides within the same group (with the same number or letter) indicate the same active ingredient or a similar mode of action. This information must be considered for the fungicide resistance management decisions. U = unknown, or a mode of action that has not been classified yet and is typically associated with another number; P = host plant defense inducers. Source: FRAC Code List 2022; <http://www.frac.info/> (FRAC = Fungicide Resistance Action Committee).

<sup>2</sup> Information provided in this table applies only to Florida. Be sure to read a current product label before applying any chemical. The use of brand names and any mention or listing of commercial products or services in the publication does not imply endorsement by UF/IFAS Extension nor discrimination against similar products or services not mentioned.

<sup>1</sup> FRAC code (fungicide group); Number (1 through 45) and letters (U and P) are used to distinguish the fungicide mode of action groups. All fungicides within the same group (with the same number or letter) indicate the same active ingredient or a similar mode of action. This information must be considered for the fungicide resistance management decisions. U = unknown, or a mode of action that has not been classified yet and is typically associated with another number; P = host plant defense inducers. Source: FRAC Code List 2022; <http://www.frac.info/> (FRAC = Fungicide Resistance Action Committee).

<sup>2</sup> Information provided in this table applies only to Florida. Be sure to read a current product label before applying any chemical. The use of brand names and any mention or listing of commercial products or services in the publication does not imply endorsement by UF/IFAS Extension nor discrimination against similar products or services not mentioned.

Table 15. Nonfumigant nematicides for carrot, beet, and radish in Florida. Contact: Johan Desaegeer, UF/IFAS Gulf Coast Research and Education Center.

Product	Application Directions
Vydate L (a.i. oxamyl) (carrot only)	Apply within one week before planting or before emergence if postplant, either broadcast (2 gal/A, incorporate 2" at least), in the seed furrow (1–2 gal/A), or via chemigation (1 gal/A). Do not apply more than 4 gal/A per season. Minimum retreatment interval is 14 days. No more than 8 applications per season. Last application at least 14 days to harvest.
Nimitz (a.i. fluensulfone)	All applications must be incorporated either physically or via drip or overhead irrigation. Make preplant applications at a rate of 3.5 to 7 pints (56.0 to 80.0 fl oz) per acre a minimum of seven days before planting. Do not plant any unlisted crops into treated land for 365 days after application of the product. Do not apply more than one application per crop, and no more than 112 fl oz of product per acre, per year (365 days). Provides control only for nematodes. Growers applying Nimitz must consult the product label to observe the plant-back (recropping) intervals for a variety of leafy vegetables and brassica crops, onions, bananas, sugarcane, and other crops.
Vydate is an insecticide/nematicide; Nimitz is a true nematicide. Unlike fumigants, these products are not volatile and will move through the soil via water; depending on the water solubility, these products will have different recommendations for how best to apply them (see specific label recommendations); when nematode pressure is high, they may not be as consistently effective against root nematodes as the fumigants.	

Table 16. Nonfumigant nematicides for sweetpotato in Florida. Contact: Johan Desaegeer, UF/IFAS Gulf Coast Research and Education Center.

Product	When to Apply	Application Pattern	Incorporation Depth	Rate
Mocap 15G (a.i. ethoprop)	2 to 3 wks preplant	Row, 12" to 15" band	2" to 4" with rotary hoe, tiller, etc. or by bedding over the band	20 to 26 lb/A or 1.6 to 2.1 per 1000 ft of row (min. row spacing 42")
Mocap EC (a.i. ethoprop)	2 to 3 wks preplant	Row, 12" to 15" band	2" to 4" deep	5.1 to 6.9 fl oz/1000 ft row
Vydate L* (a.i. oxamyl)	Within one week before planting	Broadcast, band, or in-furrow transplant drench	4" to 6" deep	2 gal/A broadcast or 1 to 2 gal/A in-furrow (Consult table for specific instructions and other uses.)
Nimitz (a.i. fluensulfone)	All applications must be incorporated either physically or via drip or overhead irrigation. Make preplant applications at a rate of 3.5 to 7 pints (56.0 to 80.0 fl oz) per acre a minimum of seven days before planting. Do not plant any unlisted crops into treated land for 365 days after application of the product. Do not apply more than one application per crop, and no more than 112 fl oz of product per acre, per year (365 days). Provides control only for nematodes. Growers applying Nimitz must consult the product label to observe the plant-back (recropping) intervals for a variety of leafy vegetables and brassica crops, onions, bananas, sugarcane, and other crops.			
Velum (a.i. fluopyram)	Apply max 6.84 fl oz/acre as an in-furrow spray during planting directed on or below seed, or using overhead chemigation equipment; or for transplanted crops, as a postplanting drench, or hill drench. Do not apply more than 13.7 fl oz of Velum (0.446 lb fluopyram) per acre per year, regardless of formulation (Velum and/or Luna) or method of application (soil or foliar). Do not apply Velum within 7 days of harvest. For soil application, to limit the potential for development of disease resistance to this chemical class, the first foliar fungicide application after Velum should be a product from a different FRAC group. The grazing of livestock in treated areas within 7 days of application is prohibited/			
Mocap and Vydate are insecticide/nematicides; Velum is a fungicide/nematicide; Nimitz is a true nematicide. Unlike fumigants, these products are not volatile and will move through the soil via water; depending on the water solubility, these products will have different recommendations for how best to apply them (see specific label recommendations); when nematode pressure is high, they may not be as consistently effective against root nematodes as the fumigants. *Vydate L has registration for nematode control on sweet potatoes only as a broadcast or in-furrow treatment. Foliar applications are registered for insect control only. For broadcast or in-furrow treatments, Vydate L should be applied in a minimum of 20 gallons of water. As a broadcast treatment thoroughly incorporate to a soil depth of 4"–6".				

Table 17. Fumigant nematicides for carrot and sweetpotato in Florida. Contact: Johan Desaegeer, UF/IFAS Gulf Coast Research and Education Center.

Nematicide	Broadcast Application <sup>1</sup>		In-the-Row Applications
	Gallons or lb per Acre	fl oz/1000 ft/ chisel-spaced 12" apart	
Telone II <sup>2,3</sup>	9 to 12 gal	26 to 35	For any row spacing, application rates given may be concentrated in the row but shall never exceed the labeled maximum for broadcast applications. Consult the product label for additional detail.
Telone C-17 <sup>2,3</sup>	10.8 to 17.1 gal	31.8 to 50.2	For any row spacing, application rates given may be concentrated in the row but shall never exceed the labeled maximum for broadcast applications. Consult the product label for additional detail.
Telone C-35 <sup>2,3</sup>	13 to 20.5 gal	38 to 60	For any row spacing, application rates given may be concentrated in the row but shall never exceed labeled maximum for broadcast applications. Consult the product label for additional detail.
Pic-Clor 60	19 to 31.5 gal	57 to 90	For any row spacing, application rates should never exceed the labeled maximum for broadcast applications. Consult the product label for additional detail.
Vapam HL	75 gal	-	For drip or in-row chisel fumigation, consult product label for proportionately reduced overall rates, drip concentration, and flow-modifying directions and procedures.
KPam HL	60 gal	-	For drip or in-row chisel fumigation, consult product label for proportionately reduced overall rates, drip concentration, and flow-modifying directions.
Allyl Isothiocyanate (AITC) Dominus	40 gal	-	For drip or in-row fumigation and crop termination, consult product label for overall rates, drip concentration, and flow-modifying directions.
<p><sup>1</sup> Gallons/acre and fl oz/1000 feet provided only for mineral soils. Higher rates may be possible for heavier-textured (loam, silt, clay) or highly organic soils.</p> <p><sup>2</sup> All of the fumigants mentioned are for retail sale and use only by state-certified applicators or persons under their direct supervision. New supplemental labeling for the Telone products must be in the hands of the user at the time of application. See new label details for additional use restrictions based on soil characteristics, buffer zones, requirements for Fumigant Management Plans (FMP) and Personal Protective Equipment (PPE), mandatory good agricultural practices (GAPs), product and applicator training certification, and other use and rate-modifying recommendations.</p> <p><sup>3</sup> Higher application rates are possible in the presence of cyst-forming nematodes.</p> <p>Rates are believed to be correct for products named, and similar products of other brand names, when applied to mineral soils. Higher rates are required for muck (organic) soils. However, the <b>grower</b> has the final responsibility to see that each product is used legally; <b>read the label</b> of the product to be sure that you are using it properly.</p>
