Forest Resource Information on the Internet: Connecting to Today’s Online Resources

Chris Demers

In 1997, the UF/IFAS School of Forest Resources and Conservation (SFRC) published *Forest Resource Information on the Internet*, which provided detailed information about the Internet: its history, structure, and how to use it. It also provided a sample of forest resource websites. Much has changed since the first publication. This is the third revision of this document, providing updated information on the latest landowner assistance websites available. These state, regional, and national resources can serve as a springboard to a wide variety of natural resource information and programs.

Software

You will need an operating system that has the standard Internet communication protocol program (TCP/IP stack is included in most Apple and Microsoft operating systems) and a web browser. Internet Explorer, Firefox, Mozilla, Google, and Safari are popular browsers that retrieve web page files from web servers and interpret the hypertext markup language (HTML) or other code to display information and images. Browsers will also allow you to print and download documents and graphics. The Adobe Acrobat Reader is the tool most commonly used to display online documents in a read-only, print-friendly format. This software is usually available for free download where print-on-demand format (PDF) documents are provided on the web. As always, respect copyrighted material and bookmark or store in your file of favorite sites the uniform resource locators (URLs) or web addresses of useful websites so that you can return to them with a simple click.

Plugging In

As the Internet grows in size and popularity, so does the number of ways to connect. Telephone lines, cable lines, and satellite are the means by which most individuals are using the Internet. Table 1 in the appendix of this publication briefly summarizes these technologies and their approximate speeds and costs. Note that with all the graphics, media, and information available on the Internet today, it is almost a requirement to have a high-speed...
connection (digital subscriber line [DSL] or better). Modems do not have the capacity to allow the user to load all the data contained in audio and video files from the web. Wi-Fi is now a popular technology for homes and businesses that allows an electronic device, such as a laptop computer, to connect to the internet wirelessly using ultra high frequency (UHF) radio waves. Wi-Fi networks are available in many businesses, like coffee shops and hotels, and usually require a password for access.

Forest Resources Information on the World Wide Web

Today the web, or cloud (as it is referred to now), is packed with natural resource information, so it is helpful to have a few centrally organized websites bookmarked to aid in your search. The resources introduced here, in alphabetical order, are good starting points for looking for more specific information and assistance.

American Forest Foundation [http://www.forestfoundation.org/](http://www.forestfoundation.org/), a nonprofit organization, encourages the long-term sustainability of America's forests, restoring wildlife habitat, and developing quality environmental education programs to assure that Americans today and in the future enjoy healthy, growing forests.

Forest Encyclopedia Network [http://www.forestencyclopedia.net/](http://www.forestencyclopedia.net/) provides natural resource professionals and the public with the scientific knowledge and tools they need to achieve their objectives. The Network is designed to connect scientific results, conclusions, and impacts with management needs and issues. The Network consists of a growing number of encyclopedias covering different fields of forest science.

Florida Forest Service [http://www.freshfromflorida.com/Divisions-Offices/Florida-Forest-Service](http://www.freshfromflorida.com/Divisions-Offices/Florida-Forest-Service) is a very useful resource for those seeking forestry information in Florida. Major sections include conservation and management, the latest silviculture best management practices, fire and forest protection, recreation, and landowner assistance.

Forest Productivity.net [http://www.forestproductivity.net/](http://www.forestproductivity.net/) provides forestland managers with the most current, unbiased, science-based, forest productivity information available in support of best management decisions on forestlands. A key objective of the website is to equip and enable natural resource managers to make better, cost-effective forest management decisions to optimize forest productivity.

Forestry Index [http://www.forestryindex.net/](http://www.forestryindex.net/) is a useful index of natural resource publications and web pages organized by topic. This site also has a search engine that allows users to find web pages on specific subjects.

Florida Land Steward [http://floridalandsteward.org/](http://floridalandsteward.org/) is the website of the Florida Land Steward Partnership, a partnership of agencies and organizations with landowner outreach as part of their mission. Florida Land Steward is a portal to the partners' web resources and is divided into sections dealing with planning for the future of your land, knowing your land, working your land, and protecting your land.

Forestry USA.com [http://forestryusa.com/](http://forestryusa.com/) is a website on forests and forestry in America. It provides access to the Internet sites of the federal and state governments, the forest industries, service and supply companies, associations and nongovernmental organizations, consultants, education and research, forestry news, employment opportunities, and more.

National Timber Tax Website [http://www.timbertax.org/](http://www.timbertax.org/) was developed to be used by timberland owners, as well as a reference for accountants, attorneys, consulting foresters, and other professionals who work with timberland owners regarding the tax treatment of timber related activities.

Southern Regional Extension Forestry [http://www.sref.info/](http://www.sref.info/) is especially useful for those seeking information about current forestry research and outreach projects in the southeastern United States. The State Resources page provides easy access to each state's forestry extension department, along with forestry schools, forestry agencies, and associations, and other useful information. It also features regional programs, projects, publications, and services.

Southern Group of State Foresters [http://www.southernforests.org/](http://www.southernforests.org/) links the state forestry agencies for the southern states, as well as other useful online forestry resources and publications.
UF/IFAS School of Forest Resources & Conservation (SFRC) Extension http://www.sfrc.ufl.edu/Extension/ has recently been revised to include Fisheries Department programs. It contains a directory of SFRC Extension faculty and staff, introductory information on the School’s Extension program, and links to forest and fisheries websites.

- One of these, Florida Forest Stewardship http://www.sfrc.ufl.edu/forest_stewardship, is a comprehensive source of forest and forest management information. It features a regularly updated events calendar and bulletin board including natural resource-related news briefs, resources for landowners, and more.

- The SFRC website is linked with the University of Florida’s primary Extension website, Solutions for Your Life http://solutionsforyourlife.ifas.ufl.edu/, where information is available related to agriculture, the environment, community development, lawn and garden, and families and youth development.

- Both of these main web portals are linked to the Electronic Data Information Source http://edis.ifas.ufl.edu/, where all the University of Florida Extension publications are stored and accessible for downloading and printing.

USDA Natural Resources Conservation Service, Florida http://www.fl.nrcs.usda.gov/ assists owners of America’s private land with conserving their soil, water, and other natural resources.

USDA Forest Service: Southern Region http://www.southernregion.fs.fed.us/ contains information about national forests, news, state and private forestry, Forest Service research, and more. Most useful to landowners is the state and private forestry section, which has information on income taxes, cooperative assistance programs, forest health, and forest management.

- Interface South http://www.interfacesouth.org/ is the component of the USDA Forest Service, Centers for Urban and Interface Forestry that focuses on wildland-urban interface (WUI) issues. This website is dedicated to heightening awareness of and providing information about WUI issues and now includes a section on wood-to-energy related topics.

Conclusions

The Internet can be a powerful learning tool if you know how to find the information you seek. Connecting to the Internet is now very simple and affordable with today’s technology. The websites introduced in this publication serve as excellent starting points from which to find specific forest resource information, organizations and services.

### Table 1. Internet Connection Comparison.

<table>
<thead>
<tr>
<th>Connection</th>
<th>Description</th>
<th>Speed</th>
<th>Hardware</th>
<th>Approximate Cost</th>
<th>Pros</th>
<th>Cons</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modem</td>
<td>Electronic translator that allows exchange of information between digital (computer) and analog (phone) signals.</td>
<td>Up to 56 Kilobytes per second (Kbps)</td>
<td>modem</td>
<td>$50–$100 for modem $20–$30/month service</td>
<td>Inexpensive. Good if not using to load or send large data files (audio, video, and many graphics).</td>
<td>Dial-up required. Low data capacity and slow—too slow to download audio and/or video files in a reasonable amount of time.</td>
</tr>
<tr>
<td>Digital Subscriber Line (DSL)</td>
<td>Carries digital signals to homes or businesses over the copper telephone lines already installed.</td>
<td>128 Kbps to 1.54 Megabytes per second (Mbps)</td>
<td>DSL modem</td>
<td>$50–$200 for modem $20–$100/month service</td>
<td>Good data capacity and speed. Ability to transfer voice, video, and data on the same line digitally so users can talk on the phone and use the Internet simultaneously, without interference to either.</td>
<td>Not available everywhere. Speed can vary widely, and the connection is faster for receiving data than it is for sending data.</td>
</tr>
<tr>
<td>Cable</td>
<td>Connects you to the Internet through a coaxial cable, often using the same line that carries your cable TV service.</td>
<td>500 Kbps to 2 Mbps</td>
<td>Cable modem</td>
<td>$75–$200 for modem $30–$70/month service</td>
<td>Greater capacity and speed than DSL, widely available, relatively inexpensive.</td>
<td>Router required (additional $50–$125) for more than one computer.</td>
</tr>
<tr>
<td>Satellite</td>
<td>For rural users that don’t have DSL in their area, satellite is becoming a more common alternative for high-speed Internet access.</td>
<td>Downstream up to 400 Kbps, Upstream limited to 128 Kbps</td>
<td>Satellite dish, Satellite modem</td>
<td>$250–$800 for hardware and installation $50–$100/month service</td>
<td>Access the Internet anywhere with clear southern exposure. Widely available.</td>
<td>Upload capacity lower than download speed. Heavy bandwidth users may be subject to “fair access policy” that limits use.</td>
</tr>
<tr>
<td>Wi-Fi</td>
<td>Connects to the Internet wirelessly using ultra high frequency (UHF) radio waves.</td>
<td>Wide range of capacity</td>
<td>Wireless router and modem</td>
<td>Hardware prices range widely from $20 to hundreds of dollars. See DSL or cable for service fees.</td>
<td>Excellent capacity and speed, able to connect anywhere in large proximity to the router, and allows connection to wireless printers and other Wi-Fi devices.</td>
<td>Wide access proximity may pose a security issue.</td>
</tr>
