Introduction

The lacy juvenile leaves of false aralia are made up of 7 to 10 slender, jagged leaflets arranged like fingers of a hand (Fig. 1). They are coppery in color when they unfold but then become a very dark grey-green. The mature foliage looks entirely different and is heavier with broader leaflets, giving a coarser silhouette. Both types of leaves can be present on the plant at the same time.

**Soil tolerances:** slightly alkaline; clay; sand; acidic; loam

**Drought tolerance:** high

**Soil salt tolerances:** poor

**Plant spacing:** not applicable

**Other**

**Roots:** usually not a problem

**Winter interest:** no special winter interest

**Outstanding plant:** not particularly outstanding

**Invasive potential:** not known to be invasive

**Pest resistance:** long-term health usually not affected by pests

**Use and Management**

False aralia provides a tropical look as a house plant indoors or in outdoor settings, whether in containers or at entranceways where its distinctive foliage casts interesting shadows on background walls. It can be pruned to develop into a small tree. Due to its upright vertical habit, false aralia is best used as an accent or specimen plant.

This somewhat branched, small evergreen tree will tolerate bright light, performing best in light shade. False aralia needs fertile, well-drained soil and protection from strong winds to develop into a nice specimen.

Propagation is by air-layering, cuttings, or seed.

Nematodes are a problem in the soil, while mites and scale can be serious leaf problems.
