A PRELIMINARY LIST OF THE TABANIDAE (DIPTERA) OF FLORIDA

By G. B. FAIRCHILD

(Continued from Vol. XIX, p. 63)

Tabanus sparus var. milleri Whit.

Miami; St. Augustine; St. Petersburg (4) (Types); Inverness, III-18, 24 (1); Ft. Myers, IV-17-16 C. P. Whitney; Gainesville; Monticello, IV-18 to V-14-35; Wacissa, VI-5-35; Port St. Joe, V-20-35. Typical sparus from New England has the eyes immaculate, Florida specimens seem always to have a single dark band, while according to Bequaert (1933) those from Staten Island may be of either type.

Tabanus stygius Say.

Georgiana, July (1); Monticello, V-27, 30-35.

Tabanus tener O. S.

Indian River (Type); Clearwater, IV-29; Ormond; Lake Mary, March; Palm Beach, III-16 (1); St. Petersburg, IV-10-14; Ft. Myers, IV-9-16; West Palm Beach, IV-9-15, all C. P. Whitney; Lake City, V-9-09; Greenville, IV-25-35; Monticello, IV-28 to VI-3-35.

Tabanus trijunctus Walk.

Very abundant, especially in the southern part of the state. St. Augustine, IV-20; Georgiana (1); Paradise Key, III-25-29; Deep Lake, V-27-34; Chokoloskee, IV-20-33; Sandy Key, Cape Sable, IV-28-33 W. J. Clench.

Tabanus trimaculatus P. de B.

Monticello, V-12, 13-35; Greenville, V-18-35.

Tabanus turbidus Wied.

Waldo; Orange Co., VI-25-29 M. M. Smith, Jr.; St. Cloud, IV-1933 (all in U. S. N. M.); Monticello, V-27 to VIII-27-35.

Tabanus vivax O. S.

Lloyd, V-12, 21, 28-35,

Tabanus wiedemanni O. S.

Enterprise, V-17-75; St. Augustine, V-19; Ormond (1); West Palm Beach, IV-4, 8-13, III-29-18 C. P. Whitney.

Tabanus pygmaeus Will.

"Florida" Williston (Type); Lloyd, VIII-22-35; Ft. Myers, VIII-11-30 R. H. Beamer (Univ. Kansas).

This little species differs strikingly from other species of Tabanus known to me in the three-segmented third antennal joint, two rather swollen annuli and a very broad and short basal portion. In addition, the frons is very broad, lacks a denuded frontal callus or occiligerous tubercle, and the eyes are bare. In general appearance it resembles a small specimen of *T. sparus* Whit. In view of its structural peculiarities, it would seem advisable to remove it from the already unwieldy genus Tabanus and place it in a separate subgenus, which I propose to call *Microtabanus*.

Dr. Alan Stone writes me that it seems close to Glaucops Szil. and that he has specimens of another species from Gainesville, IX-26 to X-2.

Tabanus (Whitneyomyia) beatificus Whit.

"Fla." Geo. D. Hulst (Type); Gainesville, V-11-25 D. M. Bates; Monticello, IV-5-35 (ex larva).

In addition to the species listed above, there are a number of others which are, for various reasons, omitted in the present list. Two species of Tabanus and one of Chrysops are in process of publication, and another species of Tabanus and two of Chrysops are being held for further study. T. fur Will. is very probably a synonym of T. fronto O. S. T. sulcifrons Macq., recedens Walk., and giganteus DeGeer, have all been recorded from the state, as has Goniops chrysocoma, but in each case there is some doubt either as to the record or the determination.
