

Mite-free groves yield top-dollar citrus.

At the first sign of mites on citrus foliage, take warning. That's the time for **KELTHANE®**, the miticide that is doing such a great job throughout California and Florida in killing citrus-attacking mites. Cover foliage thoroughly with the recommended dosage of this powerful miticide and repeat when necessary up to a week before harvest. When used as suggested, **KELTHANE** will not harm beneficial insect mite predators, but will go a long way toward producing top-quantity, top-quality fruit. Ask your farm supply dealer for **KELTHANE**.
