COVER: The kudzu bug, Megacopta cockerelli (Heteroptera: Plataspidae), is relatively new to North America, having been discovered in Georgia only in 2009. It is spreading rapidly in the Southeast, feeding not only on kudzu but also legume crops. Its tendency to aggregate during the winter months in buildings also makes it a very unwelcome addition to our fauna. You can read more about it in 2 short articles by Tillman et al. (parasitoids) and Medal et al. (host range). Photo by Lyle J. Buss.
