Additional index words. variety trial, annuals, bedding plants

#### Abstract

Rooted cuttings of vegetatively propagated annuals from Danziger "Dan" Flower Farm were planted on September 9, 2005 while rooted geranium cuttings from Fischer/Goldsmith were planted on December 1, 2005. All cultivars were planted with 3 groups of 6 plants that were randomly placed in the garden. Plants were watered 3 times a week for 30 minutes using overhead irrigation. Monthly evaluations were conducted to measure and record plant height, plant width, flower number, and quality rating. Quality was rated on a scale of 0 to 5 with $5=$ top performance, $3=$ plants of interest, $1=$ poor performance, and $0=$ dead. One consumer preference survey was conducted in March 2006. Results from the consumer preference survey and from the monthly quality ratings are presented in the text.

The trial garden at the University of Florida Fort Lauderdale Research and Education Center has been evaluating vegetatively propagated annual bedding plant cultivars for the past 3 years (Moore and Fisher, 2005; Moore et al., 2004, 2003). The trial garden was established to assist bedding plant companies with unbiased evaluations of cultivar performance of vegetative annual plants before summer trials in the rest of

the US. Winters in Fort Lauderdale are an ideal time to grow annual bedding plants in the landscape.

## Materials and Methods

Transplant production. Rooted liners from commercial companies were transplanted into 400 mL round pots filled with Pro-mix 'BX' (Premier Horticulture, Inc., Red Hill, Penn.). After transplanting, plants were placed in an opensided greenhouse exposed to ambient air temperatures of $\approx 30^{\circ} \mathrm{C}$ day/ $21^{\circ} \mathrm{C}$ night. Plants were watered daily and fertilized twice a week with $150 \mathrm{mg} \cdot \mathrm{kg}^{-1}$ of nitrogen ( N ) from $\mathrm{Pe}-$ ter's $21 \mathrm{~N}-2.2 \mathrm{P}-16.6 \mathrm{~K}$ (The Scotts Company, Marysville, O hio).

Cultivars from Danziger "Dan" Flower Farm (Israel) were placed in the greenhouse in July 2005, while cultivars from Fischer/ Goldsmith (Boulder, Colo.) were placed in the greenhouse in Oct. 2005 (Table 1).

Field evaluation. The $100 \mathrm{ft} \times 100 \mathrm{ft}$ garden has a M argate fine sand soil with $1.6 \%$ organic matter, a pH of 6.74 , a soluble salt level of $0.30 \mathrm{mS} / \mathrm{cm}, \mathrm{a} \mathrm{NO}_{3}-\mathrm{N}$ concentration of $9 \mathrm{mg} /$ kg , an $\mathrm{NH}_{4}-\mathrm{N}$ concentration of $5 \mathrm{mg} \cdot \mathrm{kg}^{-1}$, aP concentration of $27 \mathrm{mg} \cdot \mathrm{kg}^{-1}$, and a K concentration of $3.7 \mathrm{mg} \cdot \mathrm{kg}^{-1}$ ( samples collected from top 6 inches of soil). Samples were analyzed by the University of Florida's soil testing laboratory. A 3-inch mulch (partially composted woody yard waste) layer was spread over the garden to help control weeds.

Plants from Danziger were planted into the garden on September 9, 2005 while plantsfrom Fischer/ Goldsmith were planted into the garden on December 1, 2005. On each planting date, 18 plants of each cultivar were planted in the garden as 3 randomly placed groups of 6 plants per cultivar. All culti-

Table 1. List of cultivars planted in the Fort Lauderdale Trial garden in 2005. Cultivars from Danziger were planted in the garden on September 9, 2005 while cultivars from Fischer were planted in the garden on December 1, 2005.

vars were planted in the $10,000-\mathrm{ft}^{2}$ area of $30 \%$ shade. At planting, each plant was top dressed with 5 g of an $18 \mathrm{~N}-2.6 \mathrm{P}-$ 6.6K controlled-release fertilizer ( Nutricote Total 18-6-8 type 70 Florikan Corp., Sarasota, Fla.). Plants were watered overhead three times a week for 30 min .

Data collection. Monthly mean air and soil temperature, solar radiation, and rainfall were collected using the Florida Automated Weather Network (FAWN) system (Table 2). Every month plant height, plant width, flower number, and quality were recorded for each individual plant in the garden. Plant quality was based on the appearance of the group of 6 plants ( 3 groups of 6 plants for each cultivar) and took into account the number of plants in flower in a group as well as uniformity in growth and appearance. Plant quality was based on a scale of 0 to 5 with $5=$ top performance, $4=$ strong display of color and good growth habit, $3=$ plants of interest, 2 = plants are green and growing, $1=$ poor performance, and $0=$ dead.

One consumer preference survey also was conducted in which participants were asked to check all of the cultivars that they liked. This data was ranked using PROC RANK (SAS Systems, SAS Institute, Cary, N.C.) with plants being chosen more often getting a higher rank than plants that were chosen less often. The survey was conducted in March 2006. All data were then analyzed using analysis of variance to determine least significant differences (SAS Systems).

## Results and Discussion

All cultivars planted in the garden in 2005 did grow and show an increase in plant height, width, and flower number. This data is available on the Fort Lauderdale Trial Garden web site ( http:/ / flrec.ifas.ufl.edu/ Tgrdn/ trial_grdn_hm.htm). The plant quality ratings of the Danziger cultivars increased from transplanting to 171 d after transplanting (March 2006) and then started to decline (Table 3). Last year (2004-2005) the Danziger cultivars were at the peak performance approximately 60 d after transplanting (O ct. 2004) (Moore and Fisher, 2005). H owever, solar radiation levels in Aug., Oct., Nov. and Dec. 2004 were higher than levels in these months in 2005 (Moore and Fisher, 2005) (Table 2). Furthermore, growth of these cultivars might have been slowed as a result of hurricane Wilma in October 2005. The plant quality ratings of the Fisher/ Goldsmith cultivars also increased from the time of planting up through March 2006 ( 92 d after planting) and then plant quality started to decline (Table 4). These results are similar to last year with the Fischer cultivars reaching peak performance approximately 92 d after planting ( Moore and Fisher, 2005). Decline in plant quality for all plants in the garden during the month of April 2006 was probably the result of increased temperatures and solar radiation in combination with reduced rainfall (Table 2).

Of the people surveyed in March 2006 about the cultivars they liked best in the garden, they preferred the following Danziger cultivars: Calibrachoa Calimor Deep Violet, Double Impatiens Musica Pink Energy, Scaevola White, Scaevola Mini Soft Blue, and Verbena Donalena Hot Lavender (Table 5). The Fisher/ Goldsmith geraniums that they preferred were: Diablo, Tango Neon Pink, Tango Pink, Americana Deep Rose II, and Americana Violet (Table 5). The Danziger calibrachoa, scaevola, and verbena cultivars were low growing with a spreading habit making them excellent ground covers and very popular with the people surveyed. For all cultivars, the

most popular colors were the vibrant pink, violet and red colors. This is similar to previous years ( Moore and Fisher, 2005; Moore et al., 2004, 2003).

## Summary

Information about bedding plant field performance is important when making recommendations for landscape use. Because of the mild climate in south Florida, early trials are useful to evaluate plant growth, plant and flower uniformity, and floral display. Consumer surveys also help in marketing flower colors and plants that appeal to the general public.

Table 5. In March 2006, 55 people were asked to select their favorite cultivars planted in the University of Florida Fort Lauderdale trial garden. Responses were ranked with cultivars being selected by more people having a higher numerical rank than cultivars selected by fewer people. Any cultivar that was not selected had a ranking of 2.0. Rankings were analyzed using analysis of variance to determine least significant differences (LSD P $\leq 0.05=5$ ).
