**PHOTO 36.** Degradation of artificial beach fill by scarp retreat, John U. Lloyd State Recreation Area, Dania, Florida. Wave action at the base of the scarp oversteepens the scarp face and leads to slumping. Alluvial cones (arrow) frequently form at the scarp base in response to wind action and human activity along the crest. Note coarse fragments from the fill are left as a lag deposit in the intertidal zone. (Photography, 1979. Charles W. Finkl, Jr., Coastal Education and Research Foundation, Charlottesville, Virginia)
