**PHOTO 162.** Roman quarry located near R'mel, near Bizerta, north-eastern Tunisia. Building stones were extracted from a Würmian aeolianite. Presently, the bottom of the quarry is submerged under about 0.30 m of water at mean high tide, pointing to a sea-level rise since Antiquity. (Photo: Roland P. Paskoff, 10 Square Sait-Florentin, Le Chesnay 78150, France. June 1990).
