The JCR comprehensive indexes on CD are useful research tools as they facilitate rapid retrieval of information such as author names, geographic locations, scientific names, and specific subject matter.

Each volume of the JCR is indexed by contributing authors, geographic place names, and subject. Systematic indexes are sometimes provided separately if the papers in a volume-year contain numerous scientific names, otherwise the systematic index is incorporated into the subject index.

Access to most special issues can be achieved by using the CD. In some cases, papers in entire special issues are included on the CD as, for example, SI 26 Part II. Some issues are now out of print and they are included in their entirety on the CD for ease of reference.

Save time conducting literature searches. It is sometimes convenient, for example, to list all papers appearing in the JCR by one author or to find all references to specific queries such as beach erosion, beach nourishment, or shoreline.

An example of how data can be summarized using the JCR comprehensive index may be found in Finkl, C.W., 2002. Long-term trends in shore protection based on papers appearing in the Journal of Coastal Research, 1984-2000. JCR, 18(2), 211-224.

Charles W. Finkl, Editor-in-Chief
Journal of Coastal Research

The Journal of Coastal Research compiled index is still available in CD format.
We plan to have CD updates every quarter as the Journals are published.
Please visit us Online for more information about ordering or subscribing to the CD index which includes Special Issues, Bibliographies, Full articles and many illustrations.

Beautifully crafted in Red and Blue with Gold lettering.

Fergus J. Wood has left a legacy as a world famous expert on tides and tidal dynamics. He liked to describe himself as an "astro-geophysicist", linking the lunar tide cycles with the Sun and planetary periodicities as done by Otto Petterson some ninety years ago. You will want to have both of these wonderful informative volumes in your library.

The Coastal Education and Research Foundation (CERF) is a nonprofit corporation dedicated to the advancement of the coastal sciences. The Foundation is devoted to the multi-disciplinary study of the complex problems of the coastal zone. The purpose of CERF is to help translate and interpret coastal issues for the public and to assist professional research and public information programs. The Foundation specifically supports and encourages field and laboratory studies on a local, national, and international basis. Through the medium of scientific publications, television, and radio, CERF brings accurate information to the public and coastal specialists on all aspects of coastal issues in an effort to maintain or improve the quality of shoreline resources.

Because CERF is concerned with broad environmental issues, our efforts concentrate on significant problems such as maintenance of good quality (potable) water with adequate supply, and hazards associated with potential beach erosion, flooding, and susceptibility of developed shorelines to storm surge and wave attack. By focusing attention on these potential man-made and natural hazards, it is hoped that our research efforts will help others improve the quality of life in diverse coastal areas. CERF thus aims to stimulate awareness of coastal marine and freshwater shorelines and land and water problems; initiate and foster research and innovation to promote long-term coastal productivity; establish an educational forum for the debate of contentious coastal issues; and develop new principles and approaches for enlightened coastal management, and encourage their adoption and use.

CERF is associated with the Department of Geography and Geology at Florida Atlantic University in Boca Raton, Florida 33431. This association provides a basis for cooperative investigation of biophysical resources found in open and naturally protected coastal regions, estuaries, large inland bodies of water bounded by shorelines, wetlands, and other coastal environments. Joint investigative efforts by faculty, students, and staff at various institutions span a wide and diversified range of interrelated topics that are relevant to solutions of today's dynamic problems. It is hoped that these combined attempts to better understand the nature of coastal processes will help forestall what may become contentious issues of tomorrow.
