**Insecta Mundi** is a journal primarily devoted to insect systematics, but articles can be published on any non-marine arthropod. Topics considered for publication include systematics, taxonomy, nomenclature, checklists, faunal works, and natural history. **Insecta Mundi** will not consider works in the applied sciences (i.e. medical entomology, pest control research, etc.), and no longer publishes book reviews or editorials. **Insecta Mundi** publishes original research or discoveries in an inexpensive and timely manner, distributing them free via open access on the internet on the date of publication.

**Insecta Mundi** is referenced or abstracted by several sources including the Zoological Record, CAB Abstracts, etc. **Insecta Mundi** is published irregularly throughout the year, with completed manuscripts assigned an individual number. Manuscripts must be peer reviewed prior to submission, after which they are reviewed by the editorial board to ensure quality. One author of each submitted manuscript must be a current member of the Center for Systematic Entomology. Manuscript preparation guidelines are available at the CSE website.

**Abstract.** One male specimen of *Neoxantholinus cristatus* Smetana (Coleoptera: Staphylinidae), collected in 1993, is reported from Grand Cayman. The presence of that species brings to 63 the number of species of Staphylinidae reported from the Cayman Islands.

### Introduction

As part of an ongoing effort to document the Coleoptera of the Cayman Islands by M.C. Thomas, R. H. Turnbow and W.E. Steiner, I was sent a male xantholinine staphylinid (Fig. 1) labeled as follows: "CAYMAN ISLANDS, Grand Cayman, Salina Reserve, 19° 21'N, 18°08'W 17 February 1993"/ "F.J. Burton, W.E. Steiner & J.M. Swearingen, collectors"/ "under bark of rotten trunk of *Bursera simarouba*". The specimen is deposited in the Smithsonian Institution. It proved to belong to *Neoxantholinus cristatus* Smetana.

### Discussion

Smetana (1982) described the holotype male from Key West, with paratypes from Monroe, Dade, and Pinellas counties in southern Florida. None of the specimen labels of the type series provided habitat information. In my collection [JHFC] are six specimens, all from Key Largo, Monroe County, four of which I collected under bark of a hardwood log, and two from under bark of a fallen gumbo limbo tree (*Bursera simarouba* L.) Sarg.).

The finding of a specimen on Grand Cayman suggests that the species may occur also in Cuba. This find raises the reported total of Staphylinidae in the Cayman Islands (Frank et al. 2011) to 63 species.

### Acknowledgments

Thanks to Michael C. Thomas for preparing an Automontage® illustration (Fig. 1) and for reviewing this note, to Paul E. Skelley for reviewing the note, and to Warren Steiner for lending the Caymans specimen.
