Insecta Mundi is a journal primarily devoted to insect systematics, but articles can be published on any non-marine arthropod. Topics considered for publication include systematics, taxonomy, nomenclature, checklists, faunal works, and natural history. **Insecta Mundi** will not consider works in the applied sciences (i.e. medical entomology, pest control research, etc.), and no longer publishes book reviews or editorials. **Insecta Mundi** publishes original research or discoveries in an inexpensive and timely manner, distributing them free via open access on the internet on the date of publication.

Insecta Mundi is referenced or abstracted by several sources including the Zoological Record, CAB Abstracts, etc. **Insecta Mundi** is published irregularly throughout the year, with completed manuscripts assigned an individual number. Manuscripts must be peer reviewed prior to submission, after which they are reviewed by the editorial board to ensure quality. One author of each submitted manuscript must be a current member of the Center for Systematic Entomology. Manuscript preparation guidelines are available at the CSE website.

Chief Editor: David Plotkin, e-mail: insectamundi@gmail.com

Assistant Editor: Paul E. Skelley, e-mail: insectamundi@gmail.com

Head Layout Editor: Eugenio H. Nearns

Editorial Board: J. H. Frank, M. J. Paulsen, Michael C. Thomas

Review Editors: Listed on the Insecta Mundi webpage

Manuscript Preparation Guidelines and Submission Requirements available on the Insecta Mundi webpage at: <http://centerforsystemicentomology.org/insectamundi/>

opitz@kzwu.edu

Abstract. The New World genus *Chariessa* Forster (Coleoptera: Cleroidea: Cleridae) is revised and includes *C. catalina* Opitz, **new species**, *C. elegans* Horn, *C. dichroa* (LeConte), *C. floridana* Schaeffer, *C. pilosa* (Forster), *C. texana* Wolcott, *C. ramicornis* Perty, *C. vestita* (Chevrolat), and *C. duponti* (Spinola). *Enoplium pilosa* var. *marginata* Say is synonymized with *Chariessa pilosa* Forster. Lectotypes are designated for *C. pilosa* (Forster), *C. ramicornis* Perty, and *C. vestita* (Chevrolat). Available information indicates that *Chariessa* adult and immature individuals are predatory on lignicolous insects with a particular affinity for cerambycids and buprestids that infest species of oak. It is postulated that Pleistocene speciation generated the North American components of *Chariessa* with more ancient southern species generated during the Middle Tertiary; after closures of the Middle American portals and orogeny of the South American Andes. Included in this treatise is a discussion of natural history, key to species, narratives of zoogeography and phylogeny, one diagram of a phylogenetic tree, 35 line drawings, eight SEM micrographs, twelve habitus photographs, nine photographs of male genitalia, and five distributional maps.

Key Words. Taxonomy, North American zoogeography, phylogeny, new species, key to species.

Resumen. El género del Nuevo Mundo *Chariessa* Forster es revisado e incluye *C. catalina* Opitz, especie nueva, *C. elegans* Horn, *C. dichroa* (LeConte), *C. floridana* Schaeffer, *C. pilosa* (Forster), *C. texana* Wolcott, *C. ramicornis* Perty, *C. vestita* (Chevrolat) y *C. duponti* (Spinola). *Enoplium pilosa* var. *marginata* Say es puesto en sinonimia con *Chariessa pilosa* Forster. Se designan Lectotipos para *C. pilosa* (Forster), *C. ramicornis* Perty y *C. vestita* (Chevrolat). La información disponible indica que los adultos e inmaduros de *Chariessa* son depredadores de insectos lignícolas con una preferencia para cerambícidos y bupréstidos que atacan varias especies de robles (*Quercus*). Se presenta la hipótesis de que los componentes norteamericanos de *Chariessa* fueron generados a partir de especies más antiguas de Suramérica durante el Terciario Medio, después del cierre del portal Mesoamericano y la orogénesis de los Andes suramericanos. En esta publicación incluimos información sobre historia natural del género, clave de las especies, discusión sobre zoogeografía y filogenia, un diagrama de árbol filogenético, 35 dibujos, ocho fotografías de microscopía electrónica, doce fotografías de especímenes, nueve fotografías de genitalia macho y cinco mapas de distribución de especies.

Palabras Clave. Taxonomía, historia natural, zoogeografía de Norte América, filogenia, especies nueva, clave a las especies.

Introduction

This taxonomic treatise generated some interesting ancillary outcomes: the American Checkered Beetle, *Chariessa pilosa*, is arguably the most widely distributed clerid species in North America; historical material from the MCZC provided the opportunity to study specimens collected when much of our country was in its infancy; and the autochthonous *Chariessa floridana*, from Key Largo, inspired nostalgic thoughts about Bogie and Bacall in their 1948 iconic film “Key Largo”. These somber thoughts tempered the countless hours of noting distribution records that this work required. The purpose of this study is to elucidate the taxonomic richness within Peloniinae.

Materials and Methods

This study involves the morphology of 2,422 adult specimens. Males of each species were dissected to investigate aedeagal structure, and, to a lesser extent, to determine species assignment. Although

morphological criteria are used to determine specific level discontinuities, I adhere to the biological species concepts as discussed by Standfuss (1896), Dobzhansky (1937), and Mayr (1963). Morphological divergence is a useful criterion with which to hypothesize reproductive isolation. In this study, consideration for species status involves body form, color of the pubescence on the pronotal disc, shape of the antennal capitulum, and differences in the aedeagus. The methodology of Hennig (1966) was followed for estimations of supraspecific relationships, although I am in agreement with Tuomikoski (1967) who advocates the use of “apotypic” and “plesiomorphic” instead of “apomorphic” and “plesiomorphic” because phylogenetic work may not be restricted to morphological criteria.

Methods involving dissections, measurements, morphological terminology follow those described in Opitz (2010: 35). Brown (1956) was used to coin scientific names for new species. Abbreviations used in this treatise are defined as follows: EW/FW = eye width /frons width; PW/PL = pronotal width /pronotal length; EL/EW = elytral length along epipleural margin/ greatest width across elytral disc. All measurements were made at 250x. Line drawings were made with an M5 Wild stereoscopic microscope with camera lucida attachment (Leica, Wetzlar, Germany). Habitus photographs were taken with a Leica Z 16 APO microscope equipped with JVC KY-F75U-CCD camera and controlled by Syncroscopy Auto Montage software (Cambridge, United Kingdom). The SEM micrographs were produced with a Scanning Electron Microscope-S-3500N (Hitachi Science Systems, Ltd., Tokyo, Japan). To facilitate the identity of type specimens, I transcribed their locality information in the exact manner as found on labels. In the description of species, I noted the locality records nearly verbatim. I examined historical types, except those of *Lampyris pilosa* Forster and *Chariessa ramicornis* Perty.

Corporaal's catalogue (Corporaal 1950a) is an essential reference publication for every serious cleridologist. It contains an almost flawless number of world citations about Cleridae, “up to the beginning of 1950, ...”. In this revision, I have included only citations not included in Corporaal's work, except for those relevant to the original description of *Chariessa* and its species.

Assessments of evolutionary states of characters

Twelve characters were organized into a matrix (Table 1), which was then analyzed with NONA (Goloboff 2003) in combination with WINCLADA version 100.80 (Nixon 2002); to find to most parsimonious phylogenetic tree. These programs produced one tree via heuristic analysis [Maximum trees (hold) = 100, number of replications 1 (mult) = 100, and multiple TBR = TBR (mult max) were used]. Character states given the value of “0” are assessed plesiomorphic whereas those judged a value of “1” are assessed apotypic. The genus *Pelonium* Spinola was used as an outgroup, and my general knowledge of other Peloniinae genera was used to assist in character state assessments and to predict the evolutionary states of characteristics. I relied on the methods of character-state analysis employed by Ekis (now Opitz) (1977), Watrous and Wheeler (1981), and Nixon and Carpenter (1993).

Character 0 - Elytral asetiferous punctures: (0) small; (1) large

Character 1 - Pronotal arch: (0) not scabrous; (1) scabrous

Character 2 - Phallus: (0) without subapical sclerotization; (1) with subapical sclerotization

Character 3 - Pronotal sides (0) not red; (1) red

Character 4 - Elytral form: (0) not flared; (1) flared

Character 5 - Pronotal tubercle: (0) present; (1) absent

Character 6 - Pronotal disc: (0) not unicolorous; (1) unicolorous

Character 7 - Fifth visible sternite: (0) not incised; (1) incised

Character 8 - Elytral ground color: (0) not blue; (1) blue

Character 9 - Pronotal stripes: (0) not present; (1) present

Character 10 - Pronotal collar: (0) not infuscated; (1) infuscated

Character 11 - Leg color: (0) unicolorous; (1) bicolorous

Table 1. Character matrix of 12 adult morphological characters of *Pelonium* (outgroup) and species of *Charissa*.

Taxa	Characters

Natural history

Mouthpart morphology, contents of the digestive tract, and label information suggest that *Chariessa* beetles are carnivorous insects in the larval and adult stages, with particular predation on lignicolous beetles such as cerambycids and buprestids. Moreover, the available information, concerned with adult emergence from hardwoods, suggests that, as a group, the *Chariessa* species have a particular affinity for lignicolous beetles that infest tree species of *Quercus* Linnaeus (Fabaceae). Records of adult emergence of *Chariessa* individuals from wood involve 14 species of oak, they are: the California live oak (*Quercus agrifolia* Née), Arizona white oak (*Q. arizonica* Sarg.), scarlet oak (*Q. coccinea* Muenchh.), blue oak (*Q. duoglasii* Hook. & Arn.), southern red oak (*Q. falcata* Michx.), Oregon white oak (*Q. garryana* Douglas ex Hook.), silverleaf oak (*Quercus hypoleucoides* A. Camus), California black oak (*Q. kelloggii* Newb.), bur oak (*Q. macrocarpa* Michx.), chinkapin oak [*Q. muehlenbergii* (Enelm.)], Mexican blue oak (*Q. oblongifolia* Torr.), post oak (*Q. stellata* Wangenh.), eastern black oak (*Q. velutina* Lam.), and the interior live oak (*Q. wislizeni* A. DC.).

Other tree species or vine plants from whose wood chariessans have emerged, or from which they were collected include: the southern prickly ash (*Zanthoxylum clava-herculis* Linnaeus) (Rutaceae), balsam poplar (*Populus balsamifera* Linnaeus), shagbark hickory (*Carya ovata* (Mill.) K. Koch), sugar maple (*Acer saccharum* Marchall), water birch (*Betula occidentalis* Hook.), black walnut (*Juglans nigra* Linnaeus), bur oak (*Quercus macrocarpa* Michx.), Texas cedar elm (*Ulmus crassifolia* Nutt.), American elm (*Ulmus americana* Linnaeus), the honey locust (*Gleditsia triacanthus* Linnaeus), a species of strawberry tree (*Arbutus* Linnaeus), a species of conifer (*Libocedrus* Endl.), Florida poison tree [*Metopium toxiferum* (Linnaeus) Krug & Urb.], bitternut hickory [*Carya cordiformis* (Wangenh.) K. Koch], Eastern black walnut (*Juglans nigra* Linnaeus), mockernut hickory (*Carya tomentosa* Sarg.), North American fir [*Abies balsamea* (Linnaeus) Mill.], Eastern redbud (*Cercis Canadensis* Linnaeus), American persimmon (*Diospyrus virginiana* Linnaeus), wingleaf soapberry (*Sapindus saponaria* Linnaeus), on the wood of aspen (*Populus tremuloides* Michx.), boxelder (*Acer negundo* Linnaeus), downy serviceberry

Figures 1-18. [*Amelanchier arborea* (F. Michx.)] Fernald (Rosaceae)], ironwood (*Olneya tesota* A. Gray), red bud (*Cercis reniformis* Engl.), Texas cedar elm (*Ulmus crassifolia* Nutt.), a species of willow (*Salix* Linnaeus), persimmon (*Diospyrus texana* Scheele), peach (*Prunus persica* (Linnaeus) Batsh), and on logs of pecan [*Carya illinoiensis* (Wangenh.) K. Koch].

Standard collecting techniques and equipment have been used to collect these beetles. They have been captured in Malaise traps, beating tree branches laden with foliage, black light traps, flight intercept traps, and hand collected on tree boles. Altitudinally, they were captured at elevations that range from 305 to 1646 m. There is some indication that they are most prominent in mid-altitude (\pm 1000 m) montane forests.

Taxonomy

Key to adults of *Chariessa* species

- | | | |
|-------|--|---|
| 1. | Elytra strongly flared rendering hind body oblong/ovate (Fig. 32) | 2 |
| — | Elytra not strongly flared, hind body oblong/subrectangulate (Fig. 33) | 4 |
| 2(1). | Elytra vested profusely with short white setae, with circular patch of black setae (USA, Mexico, Guatemala, Costa Rica) | <i>Chariessa vestita</i> (Chevrolat) |
| — | Elytral not vested profusely with short white setae | 3 |
| 3(2). | Elytra bifasciate, one yellow fascia along anterior margin, the other behind middle (Brazil) | <i>Chariessa ramicornis</i> Perty |
| — | Elytra not fasciate, disc black, base of epipleural margin broadly reddish/yellow (Mexico) | <i>Chariessa duponti</i> (Spinola) |
| 4(1). | Pronotum unicolorous, reddish | 5 |
| — | Pronotum bicolorous, disc with black marking | 7 |
| 5(4). | Legs black (USA) | <i>Chariessa dichroa</i> LeConte |
| — | Legs mostly reddish, tarsi black | 6 |
| 6(5). | Forebody, venter, forebody and venter pubescence, pale sanguineous; elytra more black than blue (USA) | <i>Chariessa elegans</i> Horn |
| — | Forebody, venter, forebody and venter pubescence, crimson; elytra more blue than black (USA, Mexico) | <i>Chariessa catalina</i> Opitz, new species |
| 7(4). | Pronotum without two discal black lines, pronotal disc mostly red, with transverse black spot at anterior margin (USA) | <i>Chariessa texana</i> Wolcott |
| — | Pronotum with two black discal lines | 8 |
| 8(7). | Pronotal discal black lines broad and proximal to each other, without setal tuft between black lines (Fig. 31); widespread in USA (Fig. 66) | <i>Chariessa pilosa</i> Forster |
| — | Pronotal discal black lines narrow and distal to each other (Fig. 30), tuft of gold setae between black lines; known only from Key Largo (Fig. 67) | <i>Chariessa floridana</i> Schaeffer |

Chariessa Perty, 1832: 109

Winkler 1961: 62. Ekis (now Opitz) and Gupta 1971: 62. Ekis (now Opitz) 1975: 52. Mawdsley 1994: 121. Opitz 2010: 100; 2014: 25. See Corporaal (1950: 275) for more historical citations.

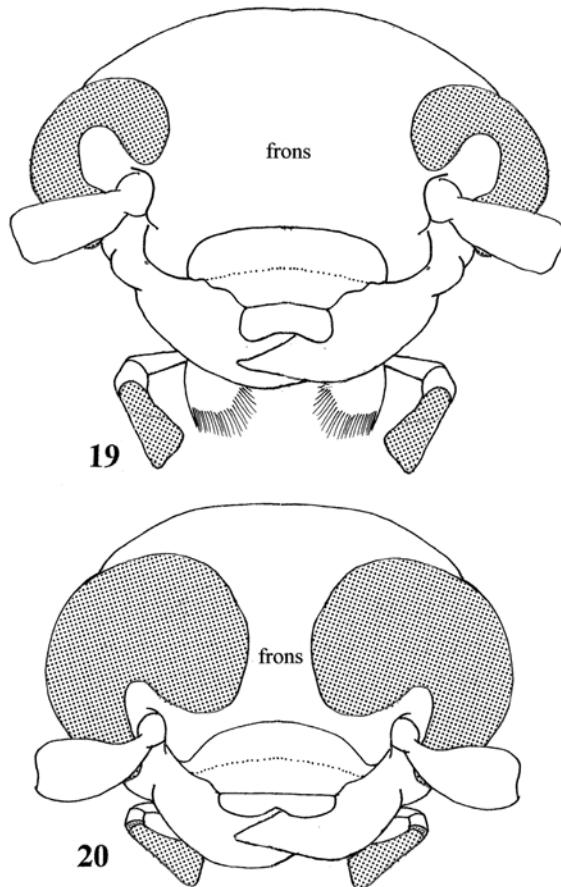

Type species. *Chariessa ramicornis* Perty 1832: 109. By original designation.

Junior synonym. *Brachymorphus* Chevrolat 1835: fascicle 7, nr. 150.

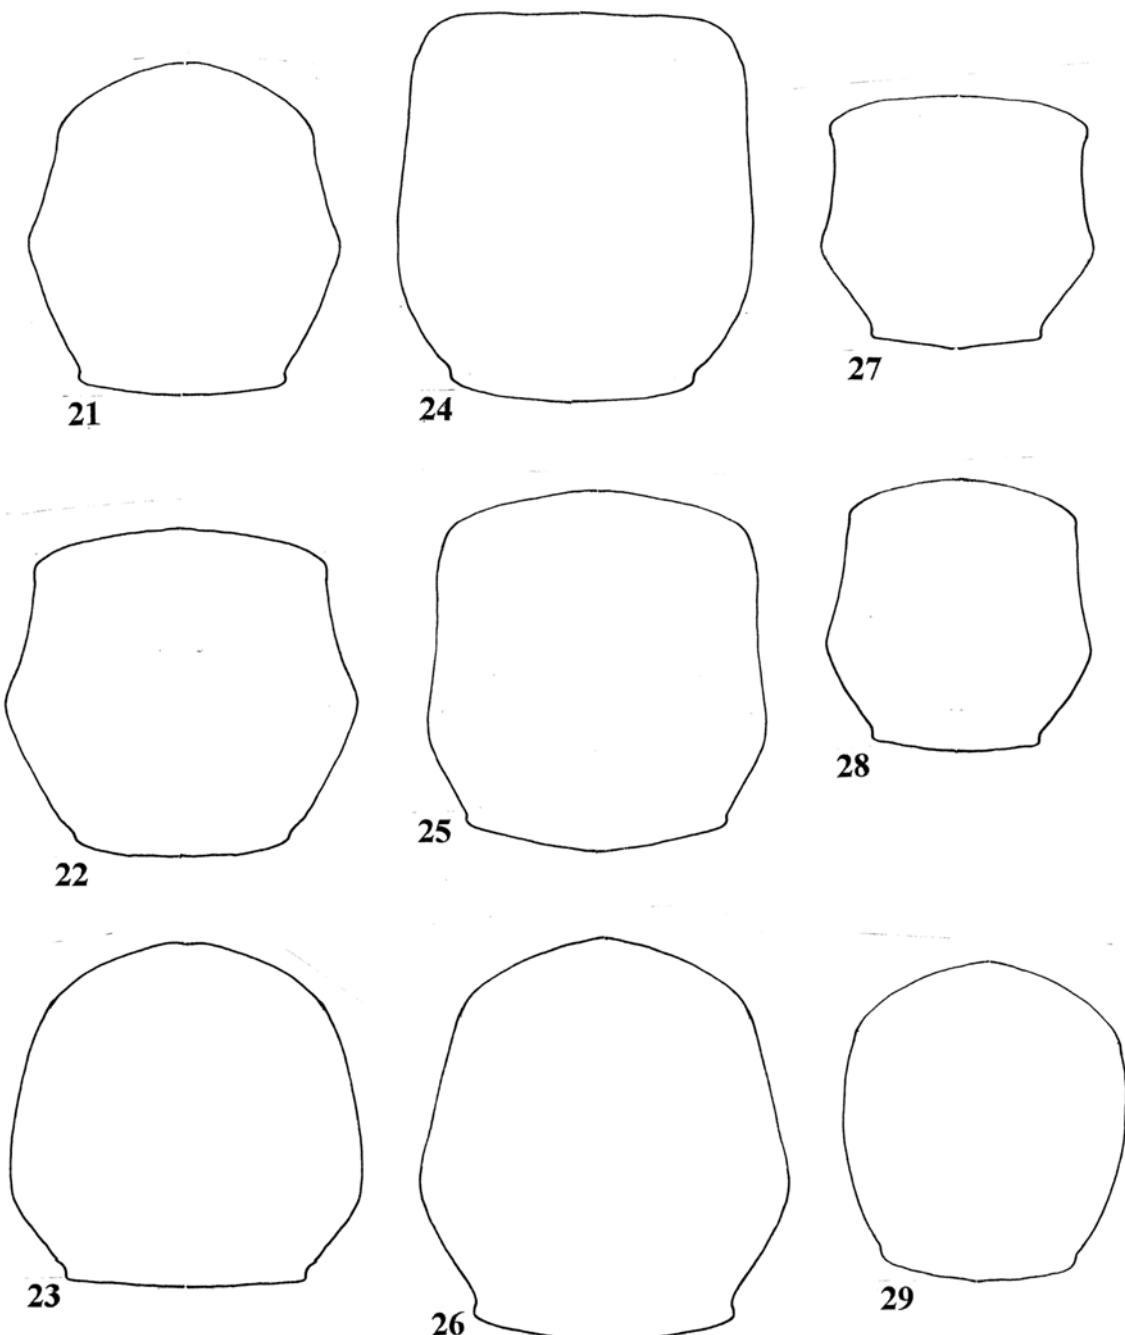

Synapotypic characteristic. Asetiferous punctations minute; phallus with subapical sclerotization.

Diagnosis. Within Peloniinae, members of *Chariessa* superficially resemble those of *Pelonium*, from which they easily distinguished by having smaller eyes, smaller ommatidia, and a much wider frons (compare Fig. 19, 20). Also, in *Chariessa* specimens, the posterior angle of the elytra is more gradually rounded than it is in those of *Pelonium* (compare Fig. 34, 35).

Redescription. Size: Length 10.0-14.0 mm; width 3.2-5.3 mm. Form: Oblong oval to suboval, body not deep, about 2.5 times longer than broad. Vestiture: Dorsum profusely vested with very short pubescence; antennal funicle moderately setose; elytra abundantly vested with short dark and pale setae, all setae emerge from small punctures. Head: Cranium quadrate (Fig. 38), frons wide, profusely indented with large setiferous punctations; gula large (Fig. 41), triangular, sutures converge, gula with two well-developed setose gular processes (Fig. 41); labrum very shallow, broadly incised distally, tormal processes not discernible, epipharyngeal plate not discernible; mandible, body stout, anterior dens blunt, medial and posterior dens well developed, penicillus well developed; maxilla, laterolacinia present, terminal palpomere securiform; labium (Fig. 40), ligula deeply incised, ligular lobes not narrowed, terminal palpomere securiform; eyes (Fig. 39) shallow, ommatidia slightly discernible, ocular notch deep; antenna (Fig. 1-18) comprised of 11 antennomeres, capitate, capitulum sex dimorphic, capitular antennomeres 9 and 10 with collateral lobes, lobes longer and more narrow in males (Fig. 3), antennomere 11 oblong. Thorax: Pronotum transverse (Fig. 42), subquadrate (Fig. 24) to subspheroid (Fig. 23), anterior limit of dorsolateral carina extends to pronotal anterior 3/4th or less, posterior angle of pronotum not discernible, disc convex and finely punctate, side margins convex, lateral tubercle faintly developed or absent, prointercoxal process narrow, not expanded distally; pronotal projections short, acuminate, they do not approximate prointercoxal process; elytron profusely sculptured with small densely scattered setiferous punctuations (Fig. 43), asetiferous punctuations obscure, usually more clearly visible in elytral anterior half, epipleural fold not abruptly narrowed at elytral middle, slightly deflexed and narrowly extended to elytral apex, elytral anterior margin not carinate; metathoracic wing, wedge cell closed; metendosternite with furcal lamina, furcal anterior plate small, subrectangulate; legs, profemora not swollen, spinous along anterior margin (Fig. 37), tibial spur formula 0-1-1, tarsal pulvillar formula 3-3-3, unguis without basal denticle (Fig. 36). Abdomen: Aedeagus shorter than length of abdomen, distal region of phallobase bilobed, phallobasic lobes fimbriate, tegmen reduced ventrally, submembranous, phallobasic struts confluent with phallobasic apodeme, phallobasic rod present; phallus acuminate distally, phallic plates very narrow; spicular plates flared, spicular apodemes fused completely; ovipositor not as long as abdomen, laminae multilobed, laminal rod present, oblique and ventral bacculi well developed. Alimentary Canal: Proventriculus well developed, ventricular crypts poorly defined; 4 cryptonephridial Malpighian tubules; stomodeal valve comprised of 4 primary folds. Mesodermal Male

Figures 19-20. Heads. **19)** *Chariessa ramicornis*. **20)** *Pelonium lampyroides*.

Figures 21-29. Pronota of *Chariessa* spp. 21) *Chariessa catalina*. 22) *C. elegans*. 23) *C. ramicornis*. 24) *C. duponti*. 25) *C. floridana*. 26) *C. texana*. 27) *C. dichroa*. 28) *C. pilosa*. 29) *C. vestita*.

Internal Reproductive Organs: Two pairs of accessory glands. Mesodermal Female Internal Reproductive Organs: Spermathecal capsule well defined; spermathecal gland attached to base of spermathecal capsule, bursa copulatrix saccular, with bursal sclerite.

Distribution. The distribution of this New World genus extends from Canada to Brazil.

***Charissa catalina* Opitz, new species**

Figures 5, 6, 21, 53, 57, 67.

Type material. Holotype: Type locality: UNITED STATES OF AMERICA, Arizona St., Catalina Mts., Redington Pass, Dec. 7, 1969 (collector not noted) (FSCA). **Paratypes:** 121 specimens. **UNITED STATES OF AMERICA: Arizona;** Gila County, Pinal Mountains, 19-3-1931, Parker Lot (AMNH, 1); Gila County, Globe, ?-III-?, D. K. Duncan (FMNH, 1); St. Catalina Mts., Redington Pass, 7-XII-1969, hackberry tree, collector not noted (FSCA, 3; WOPC, 3); *idem*, Redington pass, 7-XII-1969, collector not noted (AMNH, 1); Chiricahua Mountains, S Fork Cave Creek, emerged from the wood of a species of *Quercus* on 18-VIII-1975 (AMNH, 1; WOPC, 1); Chiricahua Mountains, Sunny Flat Campground, emerged from *Quercus* wood 23-III-1985, G. F. Knowlton (WFBM, 1); *idem*, 7-I-1981, from firewood, Carl Allen (WOPC, 1). **MEXICO: Sonora;**

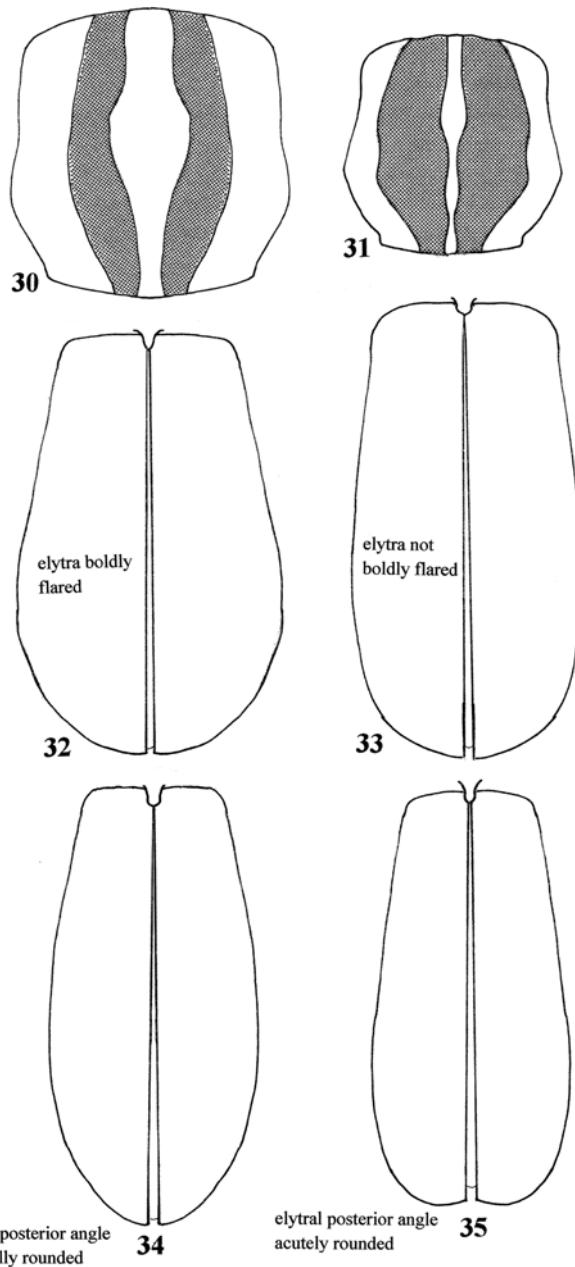

Yécora, emerged from wood of a species of *Quercus* on ?-III-2004, F. T. Hovore (WFBM, 1); 6 mi W Greaterville, 16-III-1972, F. M. & V. S. Beer (WFBC, 1)

Diagnosis. Specimens of this species are distinguished from those of the superficially similar *Chariessa elegans* by the crimson pubescence on the forebody and body venter. The forebody and body venter is more pale sanguineous, than crimson, in specimens of *Chariessa elegans*. Also, in specimens of *Chariessa catalina* the elytral disc is more bluish.

Description. Size: Length 12.0 mm; width 6.0 mm. Form: As in Fig. 53. Color: Mouthparts bicolorous, maxillary and labial palpomeres dark brown, remainder red, mandibles and labrum brown; antennae bicolorous, scape red, remainder dark brown; cranium, prothorax, pterothorax, femora, and tibiae crimson red, tarsi black; pronotal collar infuscated; abdomen flavotestaceous; mesoscutellum black; elytra dark blue. Head: Funicular antennomeres progressively shorter and wider towards capitulum, in males capitulum longer than combined length of funicular antennomeres, capitular antennomeres 9 and 10 with collateral branch (Fig. 5, 6), antennomere 11 oblong, anterior margin sinuous; eyes small, frons wider than width of eye (EW/FW 42/20). Thorax: Pronotum (Fig. 21) transverse (PW/PL 105/95), side margins with slight tubercle, disc slightly depressed at center and at sides, finely punctate; elytral asetiferous punctuation very small, profusely distributed throughout disc (EL/EW 250/75); protibial anterior margin spinous. Abdomen: Pygidium transverse/scutiform; aedeagus (Fig. 57) poorly sclerotized ventrally; phallobasic lobes fimbriate, phallobasic rod not bifid, phallobasic apodeme explanate at extremity; phallus with subapical sclerotization, phallic apex papilliform.

Variation. Size: Length 7.5-14.0 mm; width 3.2-5.0 mm. Other than body size the specimens examined are quite homogeneous

Natural history. Specimens were collected during the year-ending months and during summer months, but mostly during March. These beetles emerged from the wood of the Mexican blue oak [*Quercus oblongifolia* Torr. (Fagaceae)], and were collected from the wood of the coast live oak [*Quercus agrifolia* Née (Fagaceae)], from the wood of a hackberry tree species [*Celtis* Linnaeus (Cannabaceae)], from foliage of a species of maple [*Acer* Linnaeus (Sapindaceae)], from the wood of honey locust [*Gleditsia triacanthos* Linnaeus (Fabaceae)], and from the wood of a species of the strawberry tree [*Arbutus* Linnaeus (Ericaceae)]. One specimen was taken at 450 m.

Figures 30-35. Pronota and elytra. 30-31. Pronota. 30) *Chariessa floridana*. 31) *C. pilosa*. 32-35. Elytra. 32) *C. ramicornis*. 33) *C. texana*. 34) *C. pilosa*. 35) *Pelonium lampyroides*.

Distribution (Fig. 67). This United States species is known from Arizona, California, New Mexico, and Utah.

Etymology. The trivial name, *catalina*, constitutes a noun in apposition and refers to the type locality.

***Chariessa dichroa* (LeConte), 1860.**

Figures 10, 11, 27, 54, 58, 67.

Enoplium dichroum LeConte, 1860: 48. Holotype. Gender . Type locality: United States of America, California, Sacramento (MCZC). Corporaal, 1950: 276. Opitz, 2014: 25.

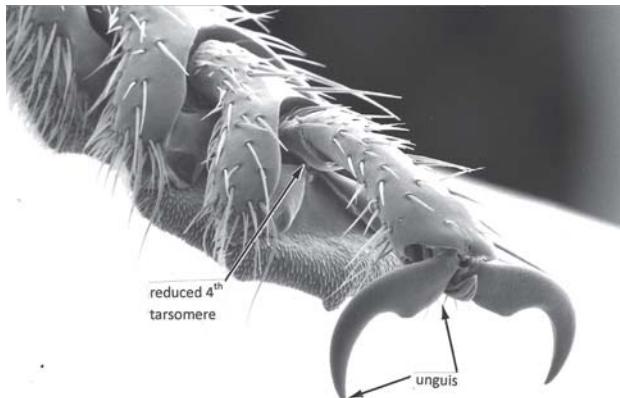

Diagnosis. Specimens of this species are distinguished from those of the superficially similar *Chariessa elegans* by body shape, shape of the antennal capitulum, and coloration of the legs. In *C. dichroa* specimens the body is oblong-slender, the antennal capitulum is less-developed (compare Fig. 7, 10), and the legs are black. In *C. elegans* the body shape is oblong-suboval, the antennal capitulum is well-developed, and the femora and tibiae are red.

Redescription. *Size:* Length 11.0 mm; width 4.0 mm. *Form:* As in Fig. 54. *Color:* Mouthparts bicolorous, maxillary and labial palpomeres dark brown, remainder red/yellow, mandibles and labrum brown; antennae and legs black; cranium, prothorax, pterothorax, and abdomen red/yellow; mesoscutellum red/yellow; elytra black, with a bluish luster. *Head:* Funicular antennomeres progressively shorter and wider towards capitulum, in males capitulum longer than combined length of funicular antennomeres, capitular antennomeres 9 and 10 with short collateral branch (Fig. 10, 11), antennomere 11 oblong, subacuminate; cranium vested with long black setae, frons wider than width of eye (EW/FW 13/25); eyes small. *Thorax:* Pronotum (Fig. 27) transverse (PW/PL 70/65), arch prominent, side margins with slight tubercle, disc vested with long black setae; elytral asetiferous punctation very small, profusely distributed throughout disc, latter densely vested with black setae (EL/EW 195/55); protibial anterior margin spinous. *Abdomen:* Pygidium transverse/scutiform; aedeagus (Fig. 58) poorly sclerotized ventrally; phallobasic lobes poorly developed, slightly fimbriate, phallobasic rod bifid distally, phallobasic apodeme explanate at extremity; phallus with subapical sclerotization, phallic apex acuminate.

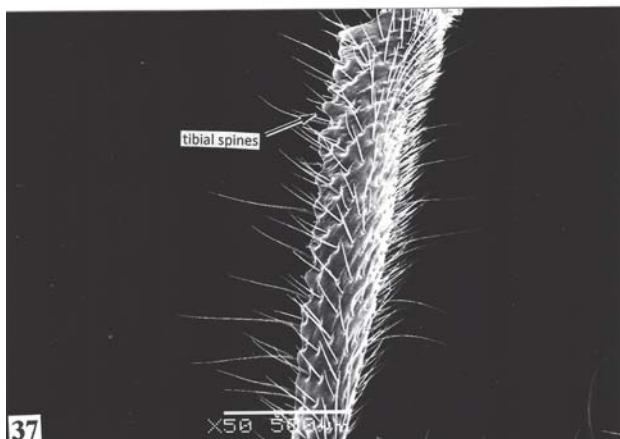

Variation. Size: Length 6.5-12.0 mm; width 2.8-4.5 mm.

Natural history. Specimens emerged from the wood of black oak [*Quercus kelloggii* Newb. (Fagaceae)], from the wood of blue oak [*Quercus douglasii* Hook & Arn. (Fagaceae)], and of the wood of the Oregon white oak [*Quercus garryana* Douglas ex Hook. (Fagaceae)]. A specimen was collected on a tree species of *Libocedrus* Endl. (Cupressaceae). Some specimens were captured in a Malaise trap set in a small open meadow in oak woodland. These beetles were taken at altitudes ranging from 263 to 762 m.

Distribution (Fig. 67). I examined 100 specimens from: UNITED STATES OF AMERICA: California; Monterey County, Arroyo Seco, 16-V-1958, on *Quercus douglasii*, E. G. Linsley; Contra Costa

Specimens are deposited in AMNH, CASC, CNCC, FMNH, MCZC, WFBM, and WOPC.

Figures 38-39. Morphological structures of *Chariessa pilosa*. **38)** Head. **39)** Eye.

***Chariessa duponti* (Spinola)**

Figures 1, 2, 24, 55, 59, 69.

Platynoptera duponti Spinola, 1844: 64. Holotype. Type locality: Mexico (MRSN). *New taxonomic placement.*

Diagnosis. In members of this species the elytra are black, except for a broadened flavotestaceous streak at the base of the epipleural margin. These characteristics will distinguish the members of this species from congeners.

Redescription. *Size:* Length 15.5 mm; width 6.6 mm. *Form:* As in Fig. 55. *Color:* Mouthparts testaceous, except mandibles and labrum dark brown; antennae, legs, pterothorax, and abdomen dark brown black; mesoscutellum black; elytra black, except base of epipleural margin broadly flavotestaceous. *Head:* Funicular antennomeres progressively shorter and wider towards capitulum, capitulum longer than combined length of funicular antennomeres, funicular antennomeres highly setose, capitular antennomeres 9 and 10 with short collateral branch (Fig. 1, 2), antennomere 11 oblong, anterior margin partially shallowly concave; cranium densely vested with dark setae, frons wider than width of eye (EW/FW 18/35); eyes small. *Thorax:* Pronotum (Fig. 24) quadrate (PW/PL 105/105), arch not prominent, side margins arcuate, disc profusely vested with orange colored setae; elytra oblong/oval, flattened, epipleural margin deflexed, asetiferous punctation minute, profusely distributed throughout disc, disc densely vested with short black setae (EL/EW 380/90); protibial anterior margin spinous. *Abdomen:* Pygidium oblong/scutiform; aedeagus (Fig. 59) poorly sclerotized dorsally and ventrally; phallobasic lobes slightly developed, fimbriate, phallobasic rod long and slender, phallobasic apodeme explanate at extremity; phallus with subapical sclerotization, phallic apex narrow/triangular.

+

Variation. *Size:* Length 13.5-19.0 mm; width 2.8-8.0 mm. The middle of the pronotal disc may or may not show a dark line.

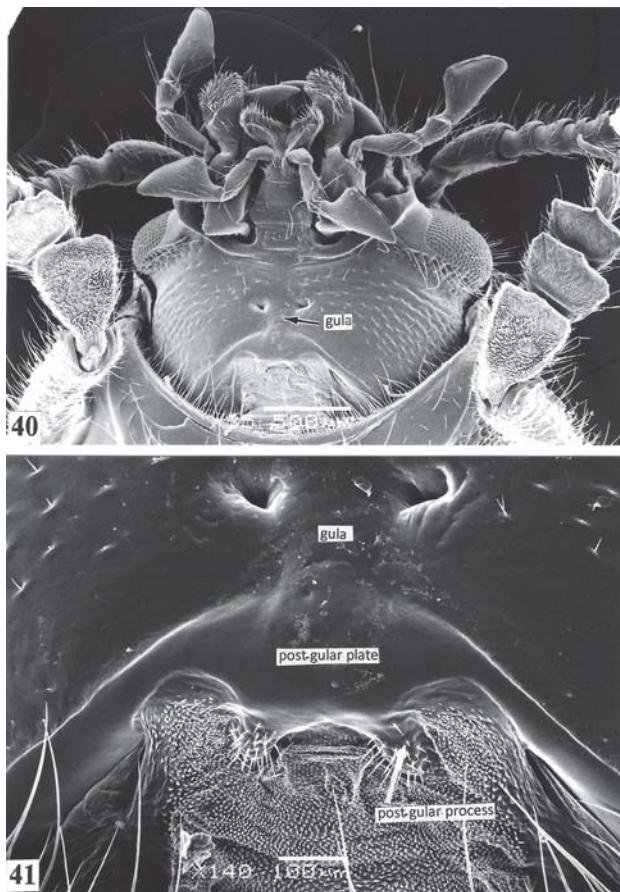

Natural history. Specimens were collected during March, May, and July. The beetle taken in July was captured on a species of oak [*Quercus* Linnaeus (Fagaceae)], at 1646 m.

Distribution. I examined 5 specimens from: **MEXICO: Tamaulipas;** Rio Corona, 18 mi N. ciudad Victoria, 13-III-1982, J. E. Gillespie; **Nuevo León;** Chipinque Mesa, near Monterrey 22-VII-1963, 5400', on *Quercus*, H. & A. Howden; 17 mi W Linares, 11-V-1994, J. E. Wappes. Specimens are deposited in ACMT, CMNC, and WFBM.

***Chariessa elegans* Horn, 1870**

Figures 7, 8, 22, 56, 60, 68.

Chariessa elegans Horn 1870: 87. Holotype. Gender not discernible. Type locality: United States of America, California, San Joaquin County (MCZC).

Figures 40-41. Morphological structures of *Chariessa pilosa*. **40**) Head (ventral view). **41**) Gular structure.

lemberti Rivers, 1894: 396.

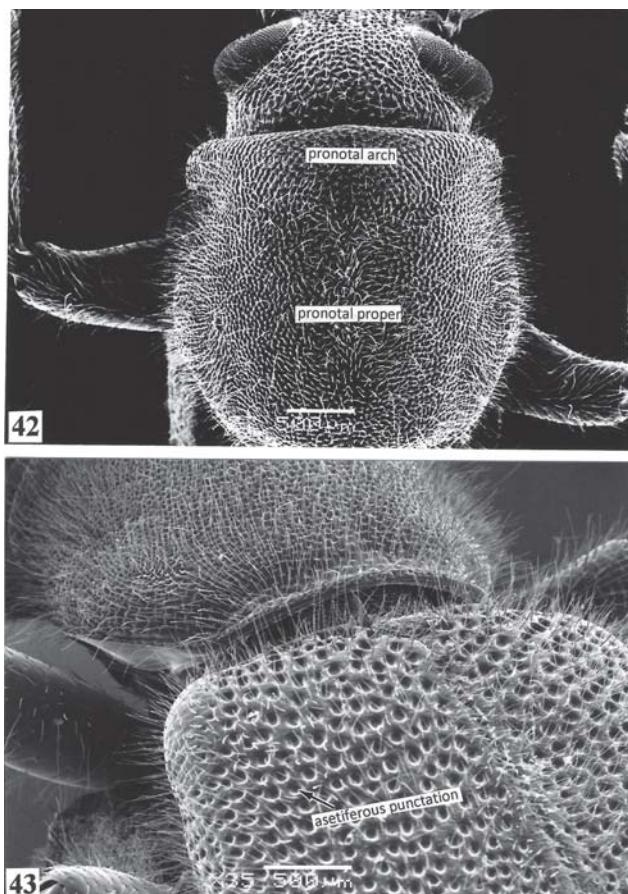

Diagnosis. Specimens of this species are distinguished from those of the superficially similar *Chariessa catalina* by the pale sanguineous coloration of the forebody and body venter. The forebody and body venter are crimson in specimens of *Chariessa catalina*. Also, in specimens of *Chariessa elegans* the elytral disc is black not blue as it is in specimens of *Chariessa catalina*.

Redescription. *Size:* Length 11.5 mm; width 5.0 mm. *Form:* As in Fig. 56. Mouthparts bicolorous, maxillary and labial palpomeres dark brown, remainder red, mandibles and labrum brown; antennae bicolorous, scape red, remainder dark brown; cranium, prothorax, pterothorax, femora, and tibiae pale sanguineous, tarsi black; abdomen flavotestaceous; mesoscutellum black; elytra dark blue. *Head:* Funicular antennomeres progressively shorter and wider towards capitulum, in males capitulum longer than combined length of funicular antennomeres, capitular antennomeres 9 and 10 with collateral branch (Fig. 7, 8), antennomere 11 oblong, anterior margin sinuous; eyes small, frons wider than width of eye (EW/FW 18/37). *Thorax:* Pronotum (Fig. 22) transverse (PW/PL 105/95), side margins with small tubercle, disc slightly depressed at center and at sides, finely punctate; elytral asetiferous punctuation very small, profusely distributed throughout disc (EL/EW 270/90); protibial anterior margin spinous. *Abdomen:* Pygidium transverse/scutiform, slightly truncate; aedeagus (Fig. 60) poorly sclerotized dorsally and ventrally; phallobasic lobes slightly developed, fimbriate, phallobasic rod not bifid distally, phallobasic apodeme explanate at extremity; phallus with subapical sclerotization, phallic apex broad/triangular.

Variation. Size: Length 7.0-13.0 mm; width 2.4-5.0 mm. Other than body size, the available specimens were quite homogeneous.

Natural history. Specimens were captured on the wood of a species of oak [*Quercus* Linnaeus (Fagaceae)], from the wood of a species of the strawberry tree [*Arbutus* Linnaeus (Ericaceae)], from the wood of a species of madrone [*Arbutus* Linnaeus (Ericaceae)], and from the wood of a species of walnut [*Juglans* Linnaeus (Juglandaceae)]. One specimen emerged from the log of a black oak [*Quercus kelloggii* Newb. (Fagaceae)], and one was taken at 1225 m.

Distribution (Fig. 68). I examined 382 specimens from: **CANADA: British Columbia;** Victoria, 5-V-1924, W. Downes; Mount Douglas, Victoria, 29-IV-1931, Thompson; S Vancouver Island, 28-V-1952, Richard Guppy; **Ontario;** Wellington, 6-VI-1950, collector not noted. **UNITED STATES OF AMERICA: California;** Tuolumne County, 10 mi W Sonora, 2-III-1965, collector not noted; Marin County, Camp Meeker, 5-V-1968, W. Wasbauer. Specimens are deposited in: AMNH, BYUC, CASC, FSCA, MCZC, USNM, WOPC.

Chariessa floridana Schaeffer, 1917

Figures 3, 4, 25, 30, 45, 61, 67.

Chariessa floridana Schaeffer, 1917: 133. Holotype . Type locality: United States of America, Florida, Key Largo (USNM).

Diagnosis. Specimens of this species are distinguished from those of the superficially similar *Chariessa pilosa* by the coloration of the pronotum. In *C. floridana* specimens, the pronotum is mostly

flavotestaceous and the black discal streaks are narrow and surround a tuft of gold-colored setae. In *C. pilosa*, the pronotum is reddish at the sides and the black discal streaks are wide (compare Fig. 30, 31).

Redescription. *Size:* Length 12.5 mm; width 3.8 mm. *Form:* As in Fig. 45. Mouthparts, cranium, antennae, pterothorax, legs, and abdomen dark brown; pronotum mostly flavotestaceous, disc with two narrow arcuate lines at middle, between which is a tuft of gold-yellow setae; elytra dark brown, epipleural and sutural margins testaceous. *Head:* Funicular antennomeres progressively shorter and wider towards capitulum, in males capitulum longer than combined length of funicular antennomeres, capitular antennomeres 9 and 10 with collateral branch (Fig. 3, 4), antennomere 11 oblong, anterior margin sinuous; eyes small, frons wider than width of eye (EW/FW 15/30). *Thorax:* Pronotum (Fig. 25) quadrate (PW/PL 85/85), side margins with small tubercle, disc finely punctate; elytral asetiferous punctuation small, profusely distributed throughout disc (EL/EW 220/50); protibial anterior margin spinous. *Abdomen:* Pygidium oblong/scutiform, deeply incised apically; 5th visible sternite emarginated; aedeagus (Fig. 61) poorly sclerotized ventrally; phallobasic lobes slightly developed, fimbriate, phallobasic rod long and narrow, phallobasic apodeme explanate at extremity; phallus with subapical sclerotization, phallic apex triangular/subacuminate.

Variation. Size: Length 11.0-15.0 mm; width 4.0-6.0 mm. There is some variation in the width of the dark pronotal lines. The epipleural and sutural margins may or may not be testaceous.

Natural history. Specimens were collected from poisonwood [*Metopium toxiferum* (Linnaeus) Krug & Urban (Anacardiaceae)] and on a rotten log of an undisclosed species of tree.

Distribution (Fig. 76). I examined 9 specimens from: UNITED STATES OF AMERICA: Florida; Monroe County, Upper Key Largo, 30-V-1976, on rotten log, M. C. Thomas & J. H. Frank; *idem*, 17-VII-1959, W. W. Warner; *idem*, 3-5-V- 1978, F. Hovore; *idem*, 24-VI- 1978, R. Turnbow; *idem*, 3-V- 1978, R. Turnbow; 1-10-IV-1979, ex *Metopium toxiferum* (Linnaeus) Krug & Urban. Specimens are deposited in FSCA, WFBM, RHTC, and USNM.

Chariessa pilosa (Forster), 1771

Figures 12, 13, 28, 31, 34, 36-43, 46, 47, 62.

Chariessa pilosa Forster, 1771: 49. Lectotype. Gender not known. Type locality: North America. Corporaal, 1950: 276. Opitz, 2014: 25. Forster did not specify as to the number of specimens that were involved in his description. Therefore, I invoke Recommendation 73F of the ICZN (1999) and designate a lectotype for this nominal species

Enoplium marginata, variety of *pilosa* proposed by Say, 1823: 187. *New Synonymy.*

Pelonium cincta Spinola, 1844: 356.

Enoplium onusta Say, 1828: Table 1, Figure 1.

Diagnosis. The members of this species resemble superficially those of *Chariessa floridana* and those of *C. texana*. In *C. floridana* specimens the dark pronotal lines are much wider apart (compare Fig. 30, 31) and in *C. texana* members the dark coloration of the pronotal disc is reduced to an anteromedial spot. Also, *C. pilosa* is widely distributed in the USA and Canada (Fig. 66), whereas *C. floridana* is known only from the Floridian Key Largo, and *C. texana* has only been taken from Texas and the panhandle of Oklahoma.

Redescription. *Size:* Length 10.0 mm; width 4.0 mm. *Form:* As in Fig. 46. Mouthparts, cranium, antennae, pterothorax, legs, and abdomen dark brown; pronotum red-yellow at sides, disc middle with two broad black lines between which is a narrow reddish line; elytra dark brown, epipleural margin testaceous beneath. *Head:* Funicular antennomeres progressively shorter and wider towards capitulum, in males capitulum longer than combined length of funicular antennomeres, capitulo antennomeres 9 and 10 with collateral branch (Fig. 12, 13), antennomere 11 oblong, anterior margin

sinuous; eyes small, frons wider than width of eye (EW/FW 15/25). *Thorax*: Pronotum (Fig. 28) slightly transverse (PW/PL 73/70), side margins with small tubercle, disc finely punctate; elytral asetiferous punctation small, profusely distributed throughout disc (EL/EW 230/60); protibial anterior margin spinous. *Abdomen*: Pygidium oblong/scutiform, faintly incised apically; 5th visible sternite emarginated; aedeagus (Fig. 62) poorly sclerotized ventrally; phallobasic lobes slightly developed, fimbriate, phallobasic rod poorly developed, phallobasic apodeme explanate at extremity; phallus with subapical sclerotization, phallic apex triangular/subacuminate.

Variation. Size: Length 7.0-15.0 mm; width 2.5-5.7 mm. The sutural and epipleural margins may be flavotestaceous, and the red color of the lateral aspects of the pronotum varies in intensity.

Natural history. Many specimens were reared from woody plants. Among these hardwoods we may include the southern prickly ash [*Zanthozylum clava-herculis* Linnaeus (Rutaceae)], the balsam poplar [*Populus balsamifera* Linnaeus (Salicaceae)], the shagbark hickory [*Carya ovata* (Mill.) K Koch (Juglandaceae)], the sugar maple [*Acer saccharum* Marchall (Sapindaceae)], the water birch [*Betula occidentalis* Hook. (Betulaceae)], the chinkapin oak [*Quercus muehlenbergii* Engelm. (Fagaceae)], black walnut [*Juglans nigra* Linnaeus (Juglandaceae)], the bur oak [*Quercus macrocarpa* Michx. (Fagaceae)], the Texas cedar elm [*Ulmus crassifolia* Nutt. (Ulmaceae)], the American elm [*Ulmus Americana* Linnaeus (Ulmaceae)], and the honey locust [*Gleditsia triacanthos* Linnaeus (Fabaceae)] while feeding on *Agrilus difficilis* Gory (Buprestidae).

These beetles were also found on the dead trunk of the post oak [*Quercus stellata* Wangenh. (Fagaceae)], the bitternut hickory [*Carya cordiformis* (Wangen.) K. Koch (Juglandaceae)], on the wood of the Eastern black walnut [*Juglans nigra* Linnaeus (Juglandaceae)], on the wood of the mockernut hickory [*Carya tomentosa* Sarg. (Juglandaceae)], on the wood of the scarlet oak [*Quercus coccinea* Muenchh. (Fagaceae)], on the wood of the North American fir [*Abies balsamea* (Linnaeus) Mill. (Pinaceae)], on the wood of the Eastern redbud [*Cercis Canadensis* Linnaeus (Fabaceae)], on the wood of the southern red oak [*Quercus falcata* Michx. (Fagaceae)], on the wood of the American persimmon [*Diospyrus virginiana* Linnaeus (Ebenaceae)], on the wood of the wingleaf soapberry [*Sapindus saponaria* Linnaeus (Sapindaceae)], on the wood of aspen [*Populus tremuloides* Michx. (Salicaceae)] eating *Agrilus* Curtis (Buprestidae), on the wood of the boxelder [*Acer negundo* Linnaeus (Apidaceae)], on the wood of the downy serviceberry [*Amelanchier arborea* (F. Michx.) Fernald (Rosaceae)], on the wood of the eastern black oak [*Quercus velutina* Lam. (Fagaceae)]. These beetles were also captured on ironwood [*Olneya tesota* A. Gray (Fabaceae)], on peach [*Prunus persica* (Linnaeus) Batsh (Rosaceae)], and on logs of pecan [*Carya illinoiensis* (Wangen.) K. Koch. (Juglandaceae)]. Some specimens were taken in a Malaise trap and others on vegetation at altitudes ranging from 650 to 680 m.

Distribution (Fig. 66). I examined 1559 specimens from: **CANADA: Alberta**; Fort MacLeod; 7 mi S Empress, 5-I-1978, reared from birch log, G. Hilchie; **Manitoba**; Criddle, ?-XII-?, collector not noted; Makinak; Onah, 8-VII-1918, J. B. Wallis; Husavik, 6-VII-1910, J. B. Wallis; Aweme, 20-VII-1912, 21-VI-1992; **Ontario**; Barry's Bay, 3-VIII-1968, on poplar eating buprestids, collector not noted; Kent County, Tilbury, ?-VI-1980, K. Stephan; Essex County, Wheatly, ?-V-1967, K. Stephan Larson's Camp, One Sided Lake, 19-VII-1962, UV light, J. C. E. Riotta; Ottawa, 10-VII-1912; Cape Chin, 6-VII-46, on maple; Constance Bay, 14-VII-1954; *idem*, 22-VI-1960, cut poplar, A. T. Howden; Rondeau Park, South Point Trail, 31-VI-1985, L. Lesage; Hamilton, 28-VI-14-VII-1982, M. Sanborne; *idem*, collection date and collector not noted; *idem*, 1-VI-1968, on log of red oak, collector not noted; Rainy River District, 7-VII-1926, J. F. Brimley; Prince Edward County, 10-VII-1940, J. F. Brimley; Sudbury, 1988; Laemington, 24-VI-1940, W. J. Brown; **Quebec**; Dosquet, Lotbiniere, 3-VIII-1985, P. Bélanger; Old Chelseae, summit King Mountain, 12-VII-1071, 1150 feet, A. T. Howden; Rignaud, Vaudreuil, 17-VI-1982, P. Bélanger; Ste-Agathe, Lotbiniére, 3-VIII-1986, Pierre Bélanger; Duparquet, 27-VI-1937, G. Stace Smith; *idem*, 2-VII-1942, G. Stace Smith; *idem*, 5-VII-1941, G. Stace Smith; *idem*, 2-VII-1941, G. Stace Smith; *idem*, 23-VII-1940, on *Abies balsamea*, G. Stace Smith; *idem*, 28-VI-1942, G. Stace Smith; Queen's Park, Aylmer, 26-VII-1923, C. B. Huchinga; Terrasse-, Vaudreuil, 20-VI-2012, on trunk of dead *Carya cordiformis*, P. de Tonnancour; Summit of Mont Rigaud, Clé Vaudreuil, 26-VI-1998, D. M. Wood; Laniel, July 29, 1935, H.

Specimens are deposited in: AMNH, BYU, CASC, CMNC, CNCI, CSUC, FSCA, MCZC, NCSU, PMNH, SEMC, TAMU, UGCA, USNM, WFBM, and WOPC.

***Chariessa ramicornis* Perty**

Figures 14, 15, 19, 23, 32, 48, 63, 70.

Chariessa ramicornis Perty, 1932: 109. Lectotype. Gender not known. Type locality: Sebastianopolin (= Brazil, São Paulo, Sebastiãoópolis do Sul) (ZSMC).

Diagnosis. In members of this species the elytra are mostly dark blue; the disc shows two yellow transverse fascia, one on the anterior margin and the other behind the middle.

Redescription. *Size:* Length 10.5 mm; width 5.0 mm. *Form:* As in Fig. 48. Mouthparts testaceous, except mandibles brown; antennae bicolored, capitulum black, remainder testaceous; cranium and pronotum black, with a bluish luster; mesothorax castaneous, pterothorax, legs, and abdomen testaceous; mesoscutellum black; elytra mostly black, with a bluish luster, with two narrow fasciae, one at anterior margin, the other behind middle. *Head:* Funicular antennomeres progressively shorter and wider towards capitulum, capitulum longer than combined length of funicular antennomeres, capillary antennomeres 9 and 10 with collateral branch (Fig. 14, 15), antennomere 11 oblong; eyes small, frons wider than width of eye (EW/FW 35/20). *Thorax:* Pronotum (Fig. 23) transverse (PW/PL 95/85), side margins evenly arcuate, disc finely punctate; elytral asetiferous punctation small, profusely distributed throughout disc (EL/EW 230/75); protibial anterior margin spinous. *Abdomen:* Pygidium scutiform; aedeagus (Fig. 63) poorly sclerotized ventrally; phallobasic lobes slightly developed, fimbriate, phallobasic rod long, linear, phallobasic apodeme broad; phallus with subapical sclerotization, phallic apex triangular/subacuminate.

Natural history. A specimen was collected during November.

Variation. Size: Length 10.0-14.5 mm; width 4.8-7.0 mm.

Distribution (Fig. 70). I examined 5 specimens from: **BRAZIL: Santa Catarina;** Nova Teutonia, ?-?1941, Fritz Plaumann; *idem*, 27-XI-1941, Fritz Plaumann: **Espírito Santo: Bahia.** Specimens are deposited in FMNH and WOPC.

***Chariessa texana* Wolcott**

Figures 9, 18, 26, 33, 49, 50, 64, 67.

Chariessa texana, Wolcott, 1908: 72. Holotype. Gender . Type locality: United States of America, Texas, Nolan County, Sweetwater (FMNH). Paratypes: Two, one of which has been located. United States of America, Texas, Nolan County, Sweetwater (FMNH)

Diagnosis. Specimens of this species are distinguished from those of the superficially similar *Chariessa pilosa* by the coloration of the pronotum, which is mostly red in *C. texana* and broadly red at the pronotal sides in *C. pilosa* specimens. Also, in *C. texana* specimens the pronotal arch shows two dark punctiform marks, which may coalesce and expand posteriorly. In *C. pilosa* specimens the pronotum always shows two black lines between which there is a narrow reddish line.

Redescription. *Size:* Length 12.0 mm; width 4.0 mm. *Form:* As in Fig. 49. Mouthparts, cranium, antennae, pterothorax, legs, and abdomen dark brown; pronotum sanguineous, disc with two black circular spots centrally located at the anterior margin; elytra black. *Head:* Funicular antennomeres progressively shorter and wider towards capitulum, capitulum longer than combined length of funicular antennomeres, capitular antennomeres 9 and 10 with collateral branch (Fig. 9, 18), antennomere 11 oblong, anterior margin sinuous; eyes small, frons wider than width of eye (EW/FW 15/35). *Thorax:* Pronotum (Fig. 26) quadrate (PW/PL 90/90), side margins with small tubercle, disc finely punctate; elytral asetiferous punctuation small, profusely distributed throughout disc (EL/EW 260/60); protibial anterior margin spinous. *Abdomen:* Pygidium oblong/scutiform, deeply incised apically; 5th visible sternite emarginated; aedeagus (Fig. 64) poorly sclerotized ventrally; phallobasic lobes slightly developed, fimbriate, phallobasic rod long and narrow, phallobasic apodeme explanate at extremity; phallus with subapical sclerotization, phallic apex triangular/subacuminatae.

Variation. Size: Length 6.0-17.0 mm; width 2.0-6.0 mm. There is polymorphism in the coloration of the elytra. In some specimens the epipleural and sutural margins are flavotestaceous. Further, the two spots on the pronotal arch may coalesce and expand posteriorly into a broad black streak.

Natural history. Specimens have emerged from a dead trunk of sugarberry [*Celtis laevigata* Willdenow (Cannabaceae)], from wood of the Oklahoma redbud [*Cercis reniformis* Engls. (Fabaceae)] infested with *Crysobothris analis* LeConte (Buprestidae), and from wood of the Texas cedar elm [*Ulmus crassifolia* Nutt. (Ulmaceae)]. These beetles were also captured on the persimmon *Diospyros texana* Scheele (Ebenaceae) and on a willow species of *Salix* Linnaeus (Salicaceae). They are attracted to light.

Distribution (Fig. 67). I examined 101 specimens from: **UNITED STATES OF AMERICA: Oklahoma;** Beaver County, near Wichita Road 26 m 30-IV-1968, J. C. Barlow; **Texas;** Uvalde County, Garner State Park, 22-24-VI-1961, R. L. Westcott; Kimble County, TTU Center Junction, 12-VI-1990, black light, J. A. Back; Harris County, 3 mi SW Westfield, 27-28-VI-1961, R. L. Westcott; Real County, 3 mi E Camp Wood, emerged from wood of *Cercis reniformis* infested with *Crysob analis* on 13-VII-1972, G. H. Nelson; *idem*, emerged from redbud infested with *Chrysob analis* and *Elaphidion* on 14-I-1972, G. H. Knull; Caldwell County, Luling, 30-VI-1972, J. Wappes; Uvalde County, 23-V-1948, D. J. & J. N. Knull; Bexar County, Jct Loop 1604 & Potranco Rd., emerged from trunk of dead *Celtis laevigata* on 4-IV-1999, T. C. MacRae & D. W. Sundberg; Babcock Rd. & Scenic Loop, near San Antonio, 11-VII-1986, on dead trunk of *Celtis laevigata* Sarg, G. H. Nelson; Leon Springs, 19-VI-1999, G. H. Nelson; East Southside Park, emerged from *Ulmus crassifolia* on ?-V-1989, D. J. Heffern; San Antonio, 4-VI-1975, uv light, M. Druckenbrod; Burnet County, 28-V-1964, K. Stephan; Potter County, Lake Meredith, McBride Canyon, 1-VI-1971, C. W. O'Brien; Taylor County, Abilene State Park, 17-VII-1982, Cicero; Kerr County, Kerrville, 22-IV-1959, Becker & Howden; Lake Corpus Christi State Park, 21-VI-1971, on *Salix*, G. H. Nelson; *idem*, 20-VI-1971, on *Salix*, G. H. Nelson; Stephens County, Clear Fork, Brazos River, Highway 183, 16-31-IV-1996, D. J. Haffern; Atascosa County, 8 miles NW Poteet, 11-17-VI-1999, J. E. Wappes; Comal County, Rittiman Ranch near Spring, Branch Oak, 3-5- IV-2003; Parker County, Weatherford, 6-XI-?, collector not noted; San Patricio County, Welder Wildlife Refuge, 17 km NE Sinton, 17-25-V- 1985, H. & A. Howden, C. Scholtz. Specimens are deposited in BYUC, CMNC, CMNH, CSUC, FMNH, FSCA, MCZC, TAMU, USNM, WFBM, and WOPC.

Notes. I examined 1558 specimens of *Chariessa pilosa* and 101 specimens of *C. texana*. The male genitalia of these two species are identical, but their pronotal coloration easily separated them, as does, to some extent, their geographic distribution. *Chariessa pilosa* extends from Texas to southern Canada, mostly east of the Rocky Mountains, whereas *C. texana* is known only from Texas and Oklahoma. Thirteen specimens from Texas present an intermediate condition of the pronotal color; the black punctiform spots on the pronotal arch extend posteriorly to reach the pronotal collar, and there is a faint red line in the middle of the dark discal line. I interpret these specimens as hybrids (Fig. 52) from a cross between *C. pilosa* and *C. texana*. They have been labeled: Hybrid, *Chariessa pilosa/Chariessa texana*.

***Chariessa vestita* (Chevrolat), 1835**

Figures 16, 17, 29, 51, 65, 70.

Brachymorphus vestitus Chevrolat, 1835: 150. Lectotype. Gender not known. Type locality: Mexico (MNHN). Corporaal 1950: 277. Opitz, 2014: 25. Chevrolat did not specify as to the number of specimens that were involved in his description. Therefore, I invoke Recommendation 73F of the ICZN (1999) and designate a lectotype for this nominal species

Corynetes spectabilis Laporte, 1836: 50.

Diagnosis. Specimens of this species are distinguished from congeners by the subrotund hind body and by the two patches of black setae at the middle of the blue elytral disc.

Redescription. *Size:* Length 13.0 mm; width 7.0 mm. *Form:* As in Fig. 51. Mouthparts, cranium, prosternum, pterothorax, legs, and abdomen testaceous; antenna bicolorous, capitulum black, remainder testaceous; pronotum black, profusely vested with white setae; elytra black, with a blue luster, profusely vested with white setae, but with two large spheroid patches of black setae. *Head:* Funicular antennomeres progressively shorter and wider towards capitulum, capitulum longer than combined length of funicular antennomeres, capitular antennomeres 9 and 10 with collateral branch (Fig. 16, 17), antennomere 11 oblong, anterior margin sinuous; eyes small, frons wider than width of eye (EW/FW 20/43). *Thorax:* Pronotum (Fig. 29) slightly transverse (PW/PL 115/110), side margins evenly arcuate, disc finely punctate; elytral asetiferous punctation small, profusely distributed throughout disc (EL/EW 260/105; protibial anterior margin spinous. *Abdomen:* Pygidium transverse/scutiform; aedeagus (Fig. 65) poorly sclerotized ventrally; phallobasic lobes slightly developed, fimbriate, phallobasic rod long and briefly bifid distally, phallobasic apodeme explanate at extremity; phallus with subapical sclerotization, phallic apex broad/triangular, phallic plates broad.

Variation. Size: Length 7.0-12.0 mm; width 4.0-7.0 mm.

Natural history. Specimens have been reared from the Texas cedar elm (*Ulmus crassifolia* Nutt. (Ulmaceae)], from the wood of the mesquite *Prosopis juliflora* (Sw.) DC. (Fabaceae), and emerged from a stalk of a grapevine [*Vitis* Linnaeus (Vitaceae)] infested with the red-headed ashborer [*Neoclytus acuminatus* Fabricius (Cerambycidae)]. They have also been collected on a species of blue wood [*Condalia* Cav. (Rhamnaceae)].

Distribution (Fig. 70). I examined 155 specimens from: UNITED STATES OF AMERICA: Texas; Hidalgo County, Mount View Acres, Ebony Hill, Research station, 22-V-1979, Roy O. Kendall & C. A. Kendall; Bentsen, Rio Grande State Park, emerged from *Prosopis* wood on 21-XII-1975, R. Turnbow; Santa Ana National Refuge, 8-9-V-1978, N. M. Downie; Bentsen State Park, ?-?-1977, reared from Cedar Elm, J. E. Wappes; *idem*, emerged from wood of cedar elm /-I-1977, J. L. Wappes; Wallacey County, N Raymondville, 26-V-1979, N. M. Downie; Live Oak County, 10 mi NE Geo. West.4-IV-1980, N. M. Downie; San Patricio County, lake Corpus Cristi State park, 26-27-IX-1976, J. E. Wappes; 2-5 m, N Sinton, 18-23-X-1978, N. M. Downie; Nueces County, Lake Corpus Christi, 24-III-1963, D. J. & J. N. Knull; *idem*, 22-III-1954, D. J. & J. N. Knull; Lake Corpus Christi State Park, 8-IV-1972, on *Acacia farnesiana*, G. H. Nelson; Live Oak County, 17 mi SW Geo. West, 23-V-1982, on *Condalia*, Marlin E Rice; Kenedy County,

7 mi S. Sarita, ?-V-1994, ex *Vitis* infested with *Neoclytus acuminatus*, D. Heffern; Bexar County, San Antonio, 14-XI-1985, D. W. Sundberg; Leon Valley, emerged from woof of *Prosopis juliflora* (Sv.) DC. on 14-VI-1979, G. H. Nelson; San Patricio County, Lake Corpus Christi State Park, 12-V-1977, slash pile, R. L. Penrose; Goliad County, Goliad State park, 17-18-V-1980, R. L. Penrose; Wilson County, Floresville, 8-V-1996, J. Hill; Galveston County, Texas City 7-VIII-1997, on Arizona ash, Quinton; Karnes County, Ecloeto, Metz Ranch, 17-IV-1997, J. E. Wappes; Harris County, by W. Houston Airport, ?-IV-1992, D. J. Heffern; Atascosa County, Junction Highway 97 & FM 1784, 3-V-1992, D. J. Heffern; Dimmit County, Chaparral V. M. A., 9-10-IV-1977, T. Friedlander; Bastrop County, Bastrop, 3-VI-1997, S. G. Wellso; Live Oak County, 5 miles NE G. West, 30-V-1979, J. E. Wappes; Zapata County, San Ygnacio, 18-III-1994, at light, W. F. Chamberlain; Travis County, Austin, ?-VI-2014, M. Quinn; Aransas County, Fulton, 17-IV-2006, R. L. Klopshinske; Kenedy County, 7 miles S Sarita, emerged from *Vitis* infested with *Neoclytus acuminatus* on 1-15-VII-1994, D. J. Heffern; Frio County, 13-III-1933, collector not noted; Guadalupe County, Cibolo Creek 4-IV-1986m D. V. Sundberg. **MEXICO: Chiapas:** 35 miles Sw Cintalapa 11-VII-1971, Clark, Murray, Hart, Schaffner: **Michoacán:** 22 mi SE Huetamo, 9-VII-1970, E. Fisher & P. Howden; 25 km SE Cañas, 26-V-1979, 150 m, J. M. & B. A. Campbell; La Pacifica, 31-V-1992, blacklight, F. Andrews & A. Gilbert; Finca Jenny, 80 km N Liberia, Parque Nacional, ?-?1990, Malaise trap; 25 km SE Cañas, 26-V-1979, J. M. Campbell; Santa Clara, Las Mercedes, 100 m, 12-VI-1928, F. Nevermann. **VENEZUELA.** Specimens are deposited in: BYUC, CASC, CMNC, FMNH, FSCA, TAMU, USNM, WFBM.

Notes. Corporaal (1950) lists Brazil as a locality for this species. This location for *C. vestita* is unconfirmed.

Zoogeographic Considerations

Five maps (Fig. 66-70) depict the approximate geographic distribution of the species of *Chariessa*. These maps show a generalized dichotomy in distribution that coincides with two major phylogroups in the hypothesized phylogeny (Fig. 44). In general, the texana-catalina lineage (descendents of progenitor D; Fig. 44) is found in more northern portions of the 30° Meridian, north of the Tropic of Cancer, whereas the duponti-ramicornis lineage (descendents of progenitor C; Fig. 44) shows a more southern distribution. The extant distribution and the evolution of the northern components were undoubtedly greatly influenced by oscillating climate events during the Pleistocene. As has been suggested by various authors (Rand 1948; Howden 1969: 43; Vuilleumier 1971: 771; Delcourt and Delcourt 1981: 145; Bartlein and Prentice 1989: 196; Knowles 2000: 1337), Pleistocene southern glacial movements had a dramatic effect on the distribution of vegetation and their associated animal fauna.

Of particular interest is the southwestern pattern of distribution of four species in the texana-catalina lineage and the autochthonous *C. floridana* from the Floridian Key Largo (Fig. 67). In contrast, the other species in the lineage, *C. pilosa*, is widely distributed in the United States and Canada with

only limited occurrence in the southwest (Fig. 66). It is postulated that the distributions of *C. catalina*, *C. dichroa*, *C. elegans*, and *C. texana* reflect Quaternary speciation events, an evolution from an ancestor that was pushed southward during the cooling periods generated by the intrusions of various Pleistocene glaciers. These species essentially evolved, and currently live, under southern relictual conditions, not able to compete with more widely, more northerly distributed *C. pilosa*. This scenario implies recent, probably Pleistocene, speciation among the species of the texana-catalina lineage, events that seem to coincide well with the findings of Rand (1948: 320). However, Bartlein and Prentise (1989: 198) and Knowles (2000: 1346) posit that the frequency of Pleistocene glacial cycles may not have provided sufficient time for speciation events to take place; which may provide an explanation for the existence of the purported *C. pilosa/texana* hybrids. Conversely, Stuart et al. (2014: 466) provide conclusive evidence for the hypothesis that, “interactions between closely related species are an important force for evolutionary diversification”, and can promote rapid evolution. This seems an important consideration for explaining the Pleistocene diversification among the species of the texana-catalina lineage, whose proximity with competing closely related species taxa, within Pleistocene refugial terrains, was undoubtedly assured by the southern migration of *C. pilosa*, *C. dichroa*, and *C. elegans*, during the various north to south glacial movements. The idea that Pleistocene glaciations caused rapid speciation in southern refugia coincides well with the known distribution of *C. floridana*. The latter exist only in the Floridian Key Largo, whose paleohistory involves terrestrial habitation earlier than 125,000 years ago, up to which time the Floridian Keys were totally inundated (Jones 1997: 116).

Another distributional point of interest is presented by the presence of *C. pilosa* on both sides of the Rocky Mountains (Fig. 66). It is probable that this distribution pattern does not reflect a trans-mountain dispersal, but a migration to the western slopes across the Wyoming Corridor (Smith and Chiszar 1996: 28).

There is considerable morphological diversity among the three more-southern species, those represented in the duponti-ramicornis lineage, which suggest a pre-Pleistocene history, perhaps during the middle Tertiary, when closures of the Middle American (Opitz 2005: 97) portals and orogenic events of the South American Andes influenced Central and South American distributions and speciation. More distributional records of these three species are needed for a more detailed zoogeographic analysis.

Phylogenetic Interpretations

My current understanding of the phylogenetic relationships for *Chariessa* species are depicted in Fig. 44 and are based strictly on adult external morphology. The phylogeny was computer generated via NONA (Goloboff 2003) in concert with Winclada version 1.00.08 (Nixon 2002). The analysis yielded one parsimonious tree with the following steps and confidence indices: L = 11; Ci = 100; and Ri = 100. A subapical sclerotization on the phallus is the basis for considering *Chariessa* to comprise a monophyletic group. Morphological analysis, the canons of Hennigian phylogenetics, and the suggested phylogenetic outcomes leads me to predict that the ancestor of the *Chariessa* species (ancestral species B) was characterized as follows: Antennae comprised of 11 antennomeres, antennomeres 9 and 10 with collateral branch, eyes comprised of small ommatidia, pronotal side margins with small tubercle, elytral disc sculptured with small asetiferous punctures, elytra not flared, and phallus with subapical sclerotization. This ancestor probably existed in South America, where today we find the more primitive members of the genus (*C. ramicornis* and *C. vestita*). The presence of *C. vestita* in more numerous northern latitudes is considered a manifestation of collecting bias.

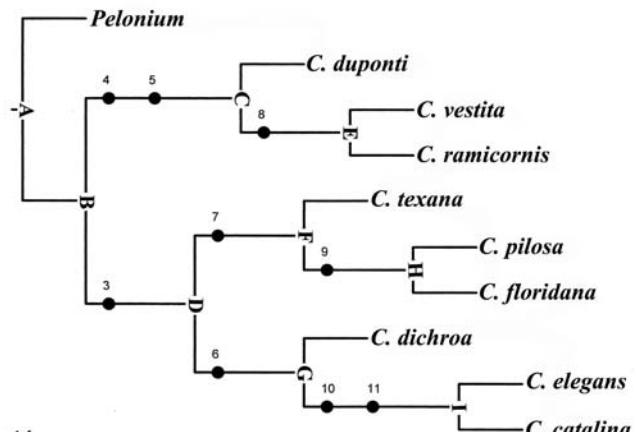

Figure 44. Hypothesized phylogenetic tree for *Chariessa* species.

Ancestral species B generated two major lineages, stemmed by progenitors C and D. In the former the pronotum remained unicolorous, the elytra became flared, and the pronotal side margins became evenly rounded. In ancestor D, the pronotum became bicolorous, the elytra remained its sub-rectangular shape, and the pronotal side margins retained a slight tubercle. Ancestral species C diversified into *C. duponti* and progenitor E, in which the elytral ground color became blue; as it is found in its progeny species *C. vestita* and *C. ramicornis*. Progenitor D, very likely of southwestern USA origin, generated ancestral species F and G. Ancestor F, in which the male pygidium became emarginated, subsequently evolved *C. texana* and progenitor H. The latter evolved a striped pronotum and subsequently produced *C. pilosa* and *C. floridana*. The further evolution of ancestor G produced *C. dichroa*, whose populations apparently flourished west of the Continental Divide, and progenitor I, in which the legs became bicolorous and the pronotal collar infuscated. Finally, ancestral species I evolved into the southwestern species *C. elegans* and *C. catalina*.

Acknowledgments

I thank the curators listed in the “Repositories of specimens” section for entrusting me with specimens in their charge. I have benefited greatly from discussions with William L. Grogan, Jr., Louis Somma, and Michael C. Thomas about historical North American biogeography. The reviews of Lionel Stange and Michael C. Thomas are much appreciated. My wife Galena provided much support in her Montage and SEM activities. My thanks to Paul E. Skelley for many departmental courtesies.
