Insecta Mundi is a journal primarily devoted to insect systematics, but articles can be published on any non-marine arthropod. Topics considered for publication include systematics, taxonomy, nomenclature, checklists, faunal works, and natural history. *Insecta Mundi* will not consider works in the applied sciences (i.e. medical entomology, pest control research, etc.), and no longer publishes book reviews or editorials. *Insecta Mundi* publishes original research or discoveries in an inexpensive and timely manner, distributing them free via open access on the internet on the date of publication.

Insecta Mundi is referenced or abstracted by several sources, including the Zoological Record and CAB Abstracts. *Insecta Mundi* is published irregularly throughout the year, with completed manuscripts assigned an individual number. Manuscripts must be peer reviewed prior to submission, after which they are reviewed by the editorial board to ensure quality. One author of each submitted manuscript must be a current member of the Center for Systematic Entomology.

Guidelines and requirements for the preparation of manuscripts are available on the *Insecta Mundi* website at <http://centerforsystematicentomology.org/insectamundi/>

Abstract. *Naviauxella varians* Wiesner and Constant, n. sp. (Coleoptera: Cicindelidae), is described. *Neocollyris (Pachycollyris) bipartita unicolor* (Horn, 1935), *Therates laotiensis* Sawada and Wiesner, 1999, *Cosmodela duponti duponti* (Dejean, 1826) and *Cylindera (Ifasina) somnuki* Naviaux, 1991 are recorded for the first time from Cambodia. Five tiger beetle species are recorded for the first time from Kampong Speu province, two for the first time from Ratanakiri province, and one each the first time from Pursat province and Preah Vihear province.

Key words. *Naviauxella varians* n. sp., diagnosis, new records, Kampong Speu, Ratanakiri, Pursat, Preah Vihear.

Introduction

This article is based on a study of some tiger beetles recently collected in Cambodia by J. Bresseel, J. Constant, P. Limbourg, V. Sougnez and X. Vermeersch. The field research was mostly in the framework of the Global Initiative project “A step further in the entomodiversity of Cambodia” managed by the second author, and resulted in some new records and the discovery of a new species. This is the ninth time that collecting results from Cambodia are reported. Previous papers were published by F. Cassola (2005), A. Matalin (2018a, 2018b) and J. Wiesner (2008, 2013, 2014, 2017, 2018), and another one is in preparation (M. Jocque et al.). The results are summarized below, enriching our scant knowledge of the tiger beetle distribution in this country (Table 1).

Materials and Methods

All measurements were made using a stereomicroscope. Measurements of body total length were made from the front of the clypeus to the apex of the elytra. The label data of type specimens were collated using the following system: in order from pin head to pin point the label data were copied with label lines. Printed white labels and rectangular shape, however, were not explicitly noted. All remaining pertinent data were recorded in brackets. The material is housed, unless otherwise stated, in the Royal Belgian Institute of Natural Sciences (RBINS), and some voucher specimens will be incorporated into the reference collection of the Royal University of Phnom Penh, Cambodian Entomology Initiative (RUPP-CEI).

Results

Tricondyla (Tricondyla) macrodera abruptesculpta Horn, 1925

(Fig. 1)

Distribution. Cambodia (Pursat), China, Vietnam.

Records. Coll. I.R.Sc.N.B. (Institut royal des Sciences naturelles de Belgique, Cambodia, Pursat Prov., Phnom Samkos, I.G. 33.345, 12°13'02"N, 102°55'07"E, 15–18.x.2016, GTI Project (Global Taxonomic Initiative), leg. J. Constant & J. Bresseel, 1 male, 2 females.

Neocollyris (Neocollyris) moesta moesta (Schmidt-Goebel, 1846)

(Fig. 2)

Distribution. Cambodia, China, Indonesia, Laos, Myanmar, Thailand, Vietnam.

Records. Coll. I.R.Sc.N.B., Cambodia, Kampong Speu prov., Phnom Aural W.S., nr Srae Ken vill., 10–14.v.2018, 200–400m, 11°59'N 104°08'E, GTI Project, leg. J. Constant & P. Limbourg, I.G. 33.732, 2 females.

Remarks. New record for Kampong Speu province.

Neocollyris (Pachycollyris) bipartita unicolor (Horn, 1935)

(Fig. 3)

Distribution. Cambodia (Pursat), Laos, Vietnam.

Records. Coll. I.R.Sc.N.B., Cambodia, Pursat Prov., Phnom Samkos, I.G. 33.345, 12°13'02"N, 102°55'07"E, 15–18.x.2016, GTI Project, leg. J. Constant & J. Bresseel, 1 female.

Remarks. New record for Cambodia and Pursat province.

Prothyma (Genoprothyma) heteromalla (Macleay, 1825)

(Fig.4)

Distribution. Cambodia (Preah Vihear, Siem Reap), Indonesia, Laos, Malaysia, Thailand, Vietnam.

Records. Coll. I.R.Sc.N.B., Cambodia, Ratanakiri prov., Yeak Laom Lake env., 9–11.x.2017, 13°44'N 107°01'E, GTI Project, leg. J. Constant & X. Vermeersch, I.G. 33.551, 3 males. Coll. I.R.Sc.N.B., Cambodia, Preah Vihear prov., Be Treed Adventures, 16–21.x.2017, 13°29'44"N 104°42'36"E, GTI Project, leg. J. Constant & X. Vermeersch, I.G. 33.551, 1 female.

Remarks. New record for Preah Vihear province.

Heptodonta eugenia Chaudoir, 1865

(Fig. 5)

Distribution. Cambodia (Kampong Speu, Koh Kong, Siem Reap), China, Laos, Malaysia, Myanmar, Thailand, Vietnam.

Records. Coll. I.R.Sc.N.B., Cambodia, Kampong Speu prov., Phnom Aural W.S., nr Srae Ken vill., 10–14.v.2018, 200–400m, 11°59'N 104°08'E, GTI Project, leg. J. Constant & P. Limbourg, I.G. 33.732, 1 male.

Remarks. New record for Kampong Speu province.

Therates laotiensis Sawada and Wiesner, 1999

(Fig. 6)

Distribution. Cambodia (Kampot), Laos.

Records. Coll. I.R.Sc.N.B., Cambodia, Kampot prov., Preah Monivong Bokor N.P., 500–1000m, 15–21.v.2018, 10°38'N 104°01'E, GTI Project, leg. J. Constant & P. Limbourg, I.G.: 33.732, 1 male.

Remarks. New record for Cambodia and Kampot province.

***Naviauxella varians* Wiesner and Constant, new species**

(Fig. 13–21)

Type depository. Holotype male, four paratype males and five paratype females in RBINS, one paratype male and one paratype female in RUPP-CEI, three paratype males and two paratype females in coll. Wiesner.

Type status. Holotype male, *type labels*: “Coll. I.R.Sc.N.B. / Cambodia, Kampong Speu prov. / Phnom Aural W.S., nr Srae Ken vill. / 10-14.v.2018, 200–400m / 11°59'N 104°08'E / GTI Project, leg. J. Constant / & P. Limbourg, I.G.: 33.732 [printed, yellow]», «HOLOTYPE / *Naviauxella* / *varians* / Wiesner & Constant ded. 2019 [printed, red]”.

Paratypes: 8 males and 8 females with the same label and “PARATYPE/ *Naviauxella* / *varians* / Wiesner & Constant ded. 2019 [printed, red]”.

Distribution. Cambodia (Kampong Speu).

Etymology. The species name *varians* refers to the high variability of elytral maculation.

Diagnosis. Using the key of Matalin (2018b: 297), *N. varians* n. sp. falls with the Thai *N. clivitatis* Naviaux, 1991, from which it is distinguished by the large apical dot of the elytral maculation and the shape of apical tip of the aedeagus, which is bent ventrally and not evenly rounded.

Description. *Size*: Total length (without labrum) males 6.4–6.9 mm (mean = 6.7mm, $n = 9$), females 7.0–7.7 mm (mean = 7.3 mm, $n = 8$). *Head*: Dark coppery above, clypeus and genae bluish green; surface smooth, glabrous, with two setigerous punctures next to each eye in front and at centre; strong longitudinal striae on vertex and orbital plates, striae becoming slightly concentric on vertex and irregular, transversely waved, behind on neck; genae roughly longitudinally striated. Eyes pale yellow. Ratio of width of head to elytra, mean = 1.0. Labrum of males (Fig. 15) light brown with darker lateral margin, distinctly wider than long, ratio of width to length, mean = 1.8; with four marginal setae and three apical teeth, middle tooth reduced and obtuse-angled, outer teeth protruding and acute-angled; with a wide, low, central carina. Labrum of females (Fig. 16) dark brown, slightly wider than long, ratio of width to length, mean = 1.1; with four marginal setae and three protruding, acute-angled apical teeth, middle tooth longer than outer teeth; with a wide, low, central carina. Mandibles yellowish, darkened on apical and inner teeth in males and completely darkened except at base in females. Labial and maxillary palpi light brown, last palpomere apically metallic dark greenish in males, completely dark greenish in females; basal labial palpomere with long, erect white setae. Antennae slender, long, reaching one-third of elytral length in males, a little shorter in females; antennomeres one to four brownish in males, darker in females, with metallic luster; scape with one long apical seta, following three antennomeres almost glabrous; antennomeres five to eleven dark blackish brown, dull, finely and evenly pubescent. *Thorax*: Pronotum as wide as long (ratio of width to length, mean = 1.0), sides somewhat rounded between transverse constrictions; glabrous, transversely waved before and behind transverse constrictions and at lateral margin, with irregular wrinkles on disc, v-shaped beside shallow middle furrow; color dark brown, transverse constrictions and lateral margins bluish green. Sterna and episterna metallic bluish black, pro- and mesothoracic coxae with some white setae, several white setae on lateral margin of metathoracic coxae and on lateral and basal margins of metasternum, scattered white setae on metepisternum, otherwise glabrous. Mesepisternum of females with a longitudinal furrow in posterior half. *Elytra*: (Fig. 17–21) twice as long as wide, ratio of width to length, mean = 1.9, parallel-sided, somewhat rounded in middle; color dark brown on disc, dark blue at lateral margin. Elytral testaceous maculation consists of a medium-sized roundish humeral dot in males only, in one case with a thin subhumeral

extension, basal and apical dots connected as a middle band, or isolated, with an apical dot of same size or smaller to nearly absent, and a large subapical dot, either comma-shaped or not. Surface with fine microsculpture on disc, some short transverse furrows near suture in basal third, and much larger, evenly spaced punctures laterally; preapical impression strong, apical microserration fine; apical border distinctly rounded and restricted towards suture, with a tiny sutural spine. Epipleura light brown. *Ventral aspect*: Venter glabrous, black with metallic green blue luster; trochanters, femora, tibiae and tarsi light brown, distal tips of segments darker; legs covered with some white setae. *Aedeagus*: (Fig. 14) in left lateral view fusiform, straight, slightly enlarged at middle, with a long and slender tapering apex, slightly bent ventrally (total length, mean 2.0 mm).

***Cylindera (Ifasina) viduata* (Fabricius, 1801)**

(Fig. 22)

Distribution. Cambodia (Kampong Speu, Koh Kong, Pursat, Ratanakiri, Siem Reap), Bangladesh, China, India, Indonesia, Laos, Malaysia, Myanmar, Nepal, Papua New Guinea, Philippines, Thailand, Vietnam.

Records. Coll. I.R.Sc.N.B., Cambodia, Kampong Speu prov., Phnom Aural W.S., nr Srae Ken vill., 10–14.v.2018, 200–400m, 11°59'N 104°08'E, GTI Project, leg. J. Constant & P. Limbourg, I.G. 33.732, 1 male, 2 females.

***Cylindera (Ifasina) viridilabris* (Chaudoir, 1852)**

(Fig. 23)

Distribution. Cambodia (Kampong Speu, Ratanakiri), Bangladesh, ?China, India, Nepal, Pakistan, Thailand.

Records. Coll. I.R.Sc.N.B., Cambodia, Kampong Speu prov., Phnom Aural W.S., nr Srae Ken vill., 10–14.v.2018, 200–400m, 11°59'N 104°08'E, GTI Project, leg. J. Constant & P. Limbourg, I.G. 33.732, 1 female.

Remarks. New record for Kampong Speu province.

***Cylindera (Ifasina) somnuki* Naviaux, 1991**

(Fig. 24)

Distribution. Cambodia (Kampong Speu), Laos, Thailand, Vietnam.

Records. Coll. I.R.Sc.N.B., Cambodia, Kampong Speu prov., Phnom Aural W.S., nr Srae Ken vill., 10–14.v.2018, 200–400m, 11°59'N 104°08'E, GTI Project, leg. J. Constant & P. Limbourg, I.G. 33.732, 2 males, 1 female.

Remarks. New record for Cambodia and Kampong Speu province.

***Cylindera (Ifasina) spinolae koratensis* Naviaux, 1991**

(Fig. 25)

Distribution. Cambodia (Kampong Speu, Kratie), Thailand.

Records. Coll. I.R.Sc.N.B., Cambodia, Kampong Speu prov., Phnom Aural W.S., nr Srae Ken vill., 10–14.v.2018, 200–400m, 11°59'N 104°08'E, GTI Project, leg. J. Constant & P. Limbourg, I.G. 33.732, 2 females.

Remarks. New record for Kampong Speu province.

***Cylindera (Eugrapha) minuta* (Olivier, 1790)**

(Fig. 26)

Distribution. Cambodia (Kampong Speu, Kratie, Ratanakiri, Siem Reap), Bangladesh, Brunei, China, India, Indonesia, Laos, Malaysia, Myanmar, Nepal, Philippines, Thailand, Vietnam.

Records. Coll. I.R.Sc.N.B., Cambodia, Ratanakiri prov., Yeak Laom Lake env., 9–11.x.2017, 13°44'N 107°01'E, GTI Project, leg. J. Constant & X. Vermeersch, I.G. 33.551, 1 female.

Remarks. New record for Ratanakiri province.

Acknowledgments

We are indebted to Alain Drumont for initiating the collaboration on this paper and making the material available for study to the first author; to David L. Pearson (Tempe, AZ) and Radomir Jaskula (Lodz) for proof-reading; and to Peter Schüle (Herrenberg) for providing the excellent pictures and drawings of *Naviauxella varians* n. sp.

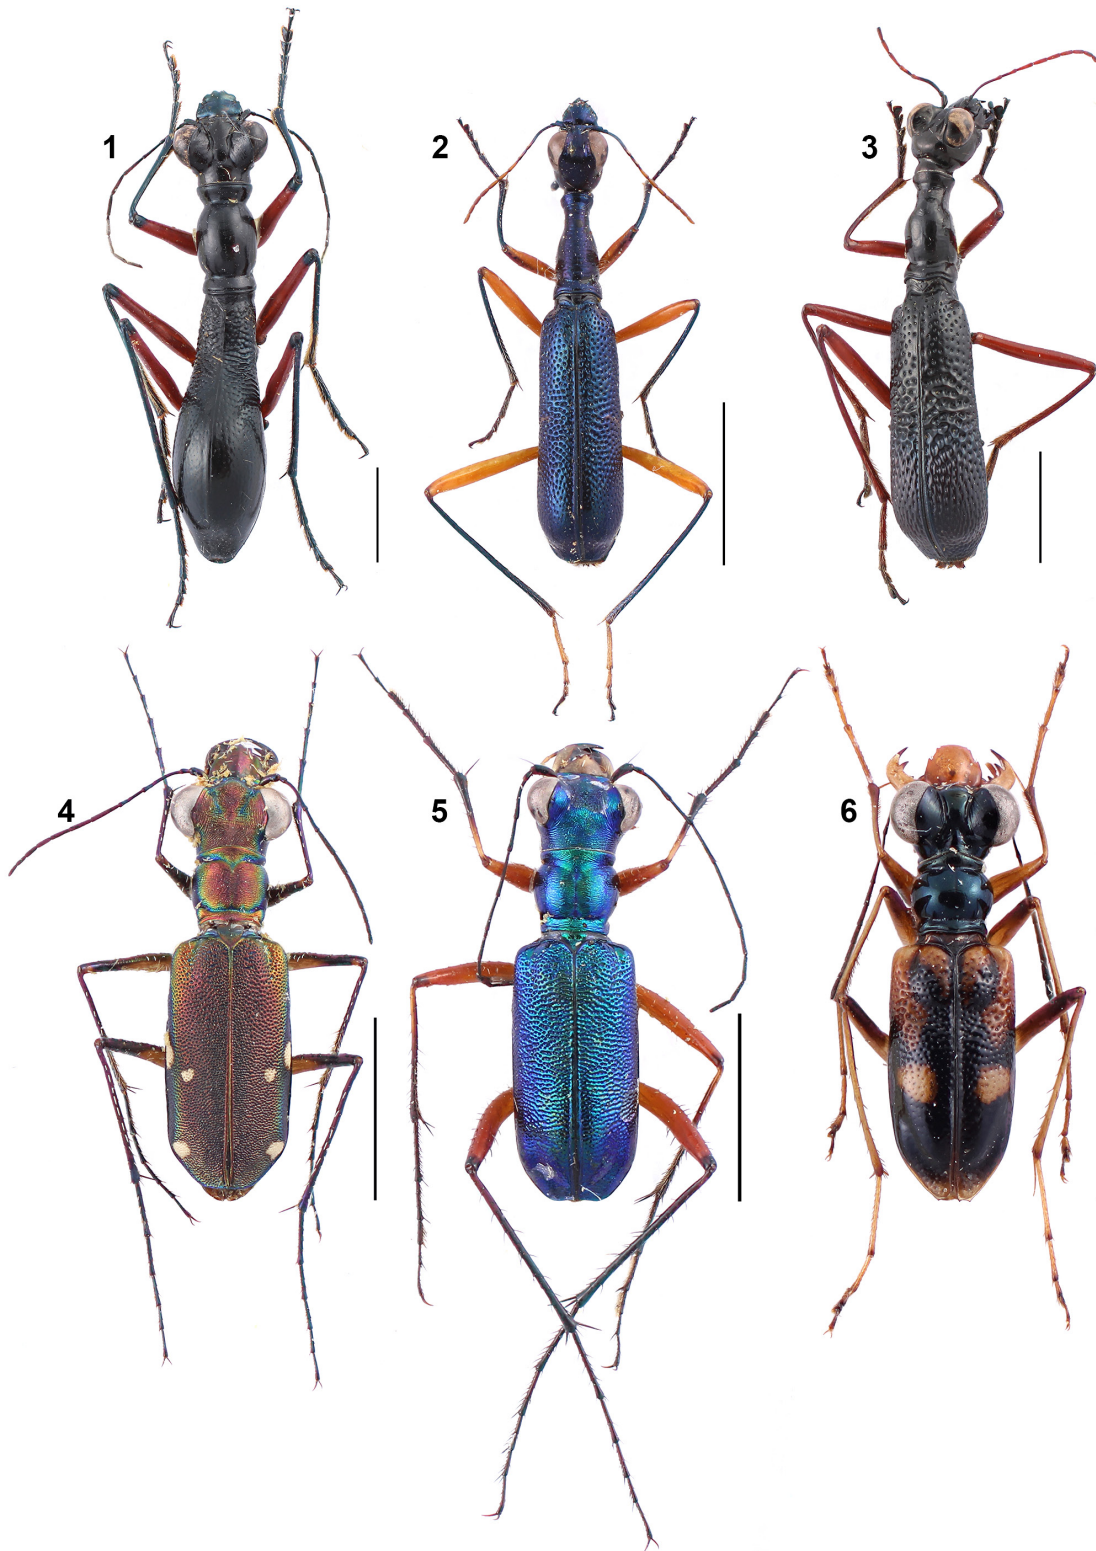

This paper is partly the result of a joint collecting trip of RUPP-CEI and RBINS, and of Jérôme Constant's project "A step further in the Entomodiversity of Cambodia" supported through a grant issued by the capacity building program of the Belgian Global Taxonomic Initiative National Focal Point that runs under the CEBioS program with financial support from the Belgian Directorate-General for Development Cooperation (DGD). We thank Mrs. Somaly Chan (Ministry of Environment of the Kingdom of Cambodia), Dr. Patrick Grootaert (RBINS), Mr. Sophany Phauk (RUPP) and his students, and Dr. Marie Lucie Susini for their support to the projects, and Mr. Joachim Bresseel, (collaborator RBINS), Dr. Vincent Sougnez (Lusigny-sur-Barse, France) and Mr. Xavier Vermeersch for volunteering during the collecting trips.
