LES DIPHTONGUES CACHEES DU VATA*

Jonathan D. Kaye
Université du Québec à Montréal

Dans cet article, j'aborde la question des suites vocaliques en vata, une langue kru parlée en Côte d'Ivoire. Je démontre qu'il y en a deux sortes: des séquences vocaliques qui impliquent deux syllabes distinctes, et les diphtongues qui représentent une suite de deux voyelles au sein d'une seule syllabe. Des facteurs morphologiques, tonologiques et phonologiques (l'harmonie vocalique) distinguent ces deux classes de suites vocaliques. Ayant établi l'existence des diphtongues en vata, je discute la définition de cette classe d'éléments. Je conclus que toutes les diphtongues du vata consistent en une suite d'une voyelle haute suivie d'une voyelle non haute. Etant donné le système vocalique de cette langue, cette définition prévoit l'existence de douze diphtongues. Or, il n'y en a que dix qui se manifestent en surface. Les diphtongues *uo* et *oo* sont exclues des formes phonétiques. Je présente des évidences pour justifier la présence de ces deux diphtongues "abstraites" dans l'éventail phonologique du vata.

1. Introduction: le système vocalique

Dans cet article je me propose de démontrer l'existence de deux diphtongues en vata qui n'apparaissent jamais en surface. Cette question me donnera aussi l'occasion de présenter en détail le système vocalique du vata.

Le vata possède un système vocalique de dix voyelles. Ce système s'organise en deux groupes vocaliques: cinq voyelles avancées¹ et cinq voyelles

*Le vata est une langue kru de la Côte d'Ivoire. Il est parlé dans cinq villages de la région Watta. Cette recherche est appuyée par une subvention de la CRSHC # 410-80-0103, et de l'Université du Québec à Montréal (F.I.R.). Je tiens à remercier Hilda Koopman, André Dugas, Doua Blé Siméon et Monik Charette de leur aide précieuse dans la préparation de cet article.

¹La "dixième voyelle", à savoir la voyelle basse avancée ne se prononce

rétractées. Les voyelles avancées et rétractées seront représentées par les traits [+ATR] et [-ATR] respectivement.

(1)	Avancées		Rétractées
	i	u	ɪ ʊ
	e	o	ɛ ɔ
	ʌ		ɑ

(2)	i	u	e	o	ʌ		ɪ	ʊ	ɛ	ɔ	ɑ
ATR	+	+	+	+	+		-	-	-	-	-
HAUT	+	+	-	-	-		+	+	-	-	-
BAS	-	-	-	-	+		-	-	-	-	+
ARRIERE	-	+	-	+	+		-	+	-	+	+

Les morphèmes du vata contiennent des voyelles qui sont du même groupe. Les voyelles d'un morphème sont, ou bien toutes avancées, ou bien toutes rétractées,² p. ex. kɔ̀lɑ̀ 'tortue', nɔ̀kpì 'ailes', kɔ̀lè 'igname', bũgbí 'mentons'.

Les suffixes nominaux et verbaux s'harmonisent avec la valeur du trait ATR du radical selon la règle (3).

(3) V → [+ATR] / $\begin{array}{c} V \\ +ATR \\ N, V \end{array}$] +__

Les effets de la règle (3) se voient dans les données en (4).

(4)	ɪʔ	'manger'		ɪʔlḛ	'manger quelque part'
	z zɔ̀	'cacher'		z zɔ̀lḛ	'cacher quelque part'
	gbɔ̀	'crier'		gbɔ̀lḛ	'crier quelque part'
	nán	'marcher'		nán lḛ	'marcher quelque part'
	nòvó	'abeilles'		nòvóyè	'une abeille'
	gɔ̀lḛ	'kolas'		gɔ̀lḛyè	'une kola'

pas dans le parler de tous les locuteurs de vata. Néanmoins, il y a bien des raisons de supposer que tout dialecte vata ait un système de dix voyelles. Voir Kaye [1980] pour l'argumentation.

²Certains mots empruntés et composés font exception à la règle: èlùwà 'chien' du baoulè àlùà ; nḗgòzè 'arc-en-ciel' nḗgò + zè .

gbó	'graines'	gbóyè	'une graine'
zɔkpò	'mouches'	zɔkpòyè	'une mouche'

A partir des données en (4) il n'est pas évident que la formulation de la règle (3) soit juste. Il y a deux autres versions possibles de cette règle:

- (5) a. $V \rightarrow [\alpha\text{ATR}] / \begin{matrix} V \\ \alpha\text{ATR} \quad N, V \end{matrix}] + \underline{\quad}$
 b. $V \rightarrow [-\text{ATR}] / \begin{matrix} V \\ -\text{ATR} \quad N, V \end{matrix}] + \underline{\quad}$

Selon (5a) les formes sous-jacentes des suffixes n'auraient pas de spécification pour le trait ATR. Elles la recevraient du radical par le biais de la règle (5a). Si l'on accepte, par contre, la règle (5b) les formes sous-jacentes des deux suffixes en (4) seraient $l\bar{e}$ et $y\grave{e}$, respectivement. Enfin selon notre analyse ces formes sont $l\bar{e}$ et $y\grave{e}$ qui sont transformées en $l\bar{e}$ et $y\grave{e}$ après les radicaux +ATR par la règle (3). Il me reste à justifier cette analyse.

Premièrement, tous les morphèmes grammaticaux pour lesquels nous avons des renseignements clairs ne possèdent que les voyelles [-ATR]. Il serait tout à fait naturel d'étendre cette généralisation à tous les morphèmes grammaticaux. Les morphèmes pour lesquels nous avons des renseignements clairs sont ceux qui exhibent une alternance impliquant le maintien ou la chute d'une consonne sonantique en position initiale. Dans ce dernier cas la chute aboutit à une séquence vocalique qui subira une règle d'assimilation du trait ATR. Or la forme qui retient la consonne sonantique possède, invariablement, une voyelle [-ATR] qui doit être considérée comme la forme sous-jacente de la voyelle. Quelques exemples se trouvent ci-dessous.

- (6) $b\grave{o} \sim \acute{o}$ article défini
 $m\grave{e} \sim \acute{e}$ démonstratif
 $m\acute{o} \sim \acute{o}$ pronom complément
 $b\bar{a} \sim \bar{a}$ forme d'insistence

Deuxièmement, il y a une règle (facultative) d'harmonie vocalique progressive impliquant le trait ATR. Cette règle a plusieurs propriétés intéressantes. Ici nous nous contentons de signaler que les voyelles [-ATR] peuvent subir la règle pour ainsi devenir [+ATR] alors qu'une voyelle [+ATR]

ne peut jamais se transformer en [-ATR]. En (7) nous donnons quelques exemples de ce processus et en (8) l'expression informelle de la règle.³

- (7) a. $\int z\bar{a}$ ó díù
 'sa nourriture' 'son pagne'
 $\int k\acute{a} z\bar{a} f\bar{I}\bar{D}'$ ó ké zē pī
 'il va acheter de la 'il va préparer la nourriture'
 nourriture'
- b. $\int k\acute{a} \eta\acute{u} n\acute{I}\acute{a} \sim * \int k\acute{a} \eta\acute{o} n\acute{I}\acute{a}$ 'il va boire de l'eau'
 óké $\eta\acute{u} n\acute{I}\acute{a}$
- $\eta\acute{I}\acute{e} gb\acute{a}z\grave{a} \sim * \eta\acute{I}\acute{e} gb\acute{a}z\grave{a}$ 'je mange un porc-épic'

- (8) $v \rightarrow [+ATR] / ___\# (\#) Co [\overset{V}{+ATR}]$

Troisièmement, le traitement des mots empruntés manifeste un comportement semblable: ces mots peuvent faire exception à la contrainte que tout morphème vata possède des voyelles qui s'accordent pour le trait ATR. Mais ces exceptions ont toutes un caractère particulier. Elles ont des voyelles [-ATR] précédées des voyelles [+ATR]. Par contre, si le mot source possède une voyelle [+ATR] précédée d'une voyelle [-ATR], cette dernière se transforme en voyelle [+ATR] dans la version vata du mot.

Considérons le mot èlùwà 'chien' emprunté au baoulé àlùù. La première voyelle étant [-ATR] et suivie d'une voyelle [+ATR], c'est-à-dire, u, est changée en e. Par contre la deuxième voyelle est, elle, suivie d'une voyelle [-ATR] mais elle ne manifeste aucune tendance à se transformer en o. D'autres exemples de ce genre sont donnés en (9).

- (9) vata baoulé
- | | | |
|---|--|-----------|
| sìk\acute{a}' | sìk\acute{a}' | 'or' |
| èf\grave{I}\grave{I} | èf\grave{I}\grave{I}' | 'albinos' |
| èf\grave{I}\acute{u}\acute{m}\acute{u}' | àf\grave{I}\acute{u}\acute{m}\acute{u} | 'âne' |
| k\grave{e}n\acute{I}' | k\grave{a}nn\acute{I}' | 'lampe' |

Encore une fois nous voyons que les changements du trait ATR vont toujours

³L'alternance a ~ e illustrée dans ces exemples est un indice de la présence d'une dixième voyelle. Voir Kaye [1980].

en sens unique. Les voyelles [-ATR] peuvent changer en voyelles [+ATR] mais jamais le contraire. Nous concluons donc que la formulation de la règle (3) est correcte ainsi que les formes sous-jacentes qui s'ensuivent. Nous sommes prêts à aborder la question des diphtongues en vata.

2. Les diphtongues

Au sein des morphèmes en vata se trouvent des suites vocaliques. Des exemples sont fournis en (10).

(10) a.	-ATR		+ATR	
	ció	'apprendre'	búmiλ	'mouches à fruit'
-arrière	dié	'couper (imperf.)'	siē	'rire (imperf.)'
	dió	'cesser (imperf.)'	búmiò	'mouche à fruit'
b.	kóð	'hommes'	yuλ	'enfants'
	lōē	'éléphant'	zué	'hier'
+arrière	(o)	inexistante	(uo)	inexistante

Le tableau (10) s'organise de la manière suivante: à gauche se trouve toutes les suites vocaliques dont les membres sont [-ATR], à droite, les suites vocaliques [+ATR]. En (10a) le premier membre de la suite est une (semi)voyelle [+haut, -arrière] (i ou ɪ). En (10b) le premier membre est [+haut, +arrière] (u ou o). Il est possible de caractériser les suites vocaliques selon la formule suivante:

- (11) Une suite vocalique en vata consiste en une voyelle [+haut] suivie par une voyelle [-haut]. De plus, les voyelles doivent s'accorder sur le trait ATR.

Si l'on regarde le tableau (1), on voit que la formule (11) prévoit douze suites vocaliques, à savoir pour chaque groupe de cinq voyelles [+ATR] il y a deux voyelles hautes et trois voyelles non-hautes. En (10) on voit que dix sur les douze possibilités logiques se réalisent phonétiquement, o et uo n'apparaissant jamais en surface. Dans la section 2.1, je présenterai des évidences montrant que les suites vocaliques en (10) sont bel et bien des diphtongues, c'est-à-dire que du point de vue de la structure syllabique, elles s'analysent comme dans (12a) et non pas comme dans (12b).⁴

⁴Voir Kaye and Lowenstamm [1980] et Vergnaud and Halle [1978] pour le

(12) a.

ciá 'apprendre'

zué 'hier'

b.

Deuxièmement, en section 2.2 j'argumenterai pour montrer l'existence de deux diphtongues cachées: les deux diphtongues manquantes du tableau (10), uo , ∞ .

2.1. Les diphtongues et les séquences vocaliques. En vata, il est important de distinguer deux sortes de suites vocaliques: les diphtongues dont la structure syllabique est comme dans (12a) et les séquences vocaliques qui ont une structure semblable à celle de (12b). Autrement dit, les séquences vocaliques forment deux syllabes distinctes alors que les diphtongues ont une analyse monosyllabique. En (13) ci-dessous, je donne une "paire minimale". L'exemple (13a) est une diphtongue et (13b) une séquence vocalique. Bien que la différence soit subtile, elle est quand même perceptible au niveau phonétique. Quoi qu'il en soit le comportement phonologique ne laisse aucun doute concernant le statut phonologique respectif de ces deux formes.

(13) a. sɪá 'escargot'

lɪá 'chansons (dér)'

Maintenant je passe aux arguments appuyant une analyse diphtongale pour les formes de (10).

En général, le vata ne permet pas de séquences vocaliques au sein d'un morphème. Les exceptions sont des noms propres, $y\acute{a}\acute{o}$, 'Yao' et des mots empruntés, $\acute{a}\acute{n}\acute{a}\acute{o}$ 'chat'. Le reste des séquences vocaliques apparaissant à l'intérieur d'un seul morphème, se conforment à la définition (11), à savoir une voyelle [+haut] suivie par une voyelle [-haut] (voir (10)). Si l'on considère que ces dernières séquences sont des diphtongues, on peut bien propo-

cadre théorique des structures syllabiques.

ser que le vata possède une contrainte inframorphologique contre les séquences vocaliques.

Du point de vue du ton, les séquences comme celles de (10) se comportent comme une seule syllabe. Il n'y a qu'un ton pour toute la séquence, et de plus, si le ton change à cause d'une règle tonologique, le changement touche toute la séquence.

(14) a.	h pá	'je lance'	h pá	'tu lances'
	h pá̀	'j'ai lancé'	h pá̀	'tu as lancé'
	h cíá	*h cíá	h cíá	'tu apprends'
	h cíá̀	*h cíá̀	h cíá̀	'tu as appris'
b.	h sié	*h siē	h siē	'tu ris'
	h sié̀	*h siḕ	h siḕ	'tu as ri'
		*h siè		

Les exemples de (14a) illustrent une règle qui fait monter un ton mi-haut à haut après un ton mi-haut. En (14b) nous voyons une règle qui fait monter un ton moyen à mi-haut après un ton mi-haut, aussi qu'une règle qui fixe une copie du ton précédant sur un ton bas. Cette dernière règle ne s'applique pas si la syllabe qui porte le ton bas est suivi immédiatement par une voyelle. En tous ces cas les diphtongues se comportent exactement comme des voyelles simples. Ces faits découleront automatiquement si l'on présume qu'un ton est associé avec chaque syllabe et que les séquences en (10) constituent une seule syllabe.

Il est à noter qu'il n'y a aucune condition en vata disant qu'une séquence vocalique possède toujours un ton. Les séquences qui franchissent une frontière morphologique manifestent assez souvent deux tons différents.

díǔ	'villages (d'éf)'	h ǔǔ	'je le mange'
(dí + ǔ)		(lé ǔ)	

En outre, les exemples des séquences vocaliques qui ne se conforment pas à (11) à l'intérieur d'un morphème peuvent avoir aussi deux tons distincts: yáǔ 'Yao', àpáǔ 'chat.

Une autre évidence pour le statut diphtongal des séquences en (10) nous est fournie par la règle d'harmonie vocalique dont j'ai parlé en (7) et (8)

ci-haut. Primo, la règle (8) n'affecte que la dernière syllabe des mots polysyllabiques.

- (15) a. \acute{h} ká zā pī 'je vais préparer de la nourriture'
 je vais nourriture préparer
- \acute{h} ké zē pī
- b. \acute{h} ká sá ká pī 'je vais préparer du riz'
 je vais riz préparer
- \acute{h} ká sá ké pī
- * \acute{h} ká sé ké pī

Alors qu'en (15a) la forme monosyllabique zā est transparente par rapport au processus (8), la forme bisyllabique sá ká en (15b) ne se laisse changer que sa dernière syllabe.

Secundo, les séquences intramorphologiques peuvent elles subir la règle (8), mais elles ne permettent pas que ce processus aille plus loin.

- (16) \acute{h} ká zāā pí 'je vais préparer la nourriture'
 je vais nourriture déf. préparer
- \acute{h} ká zēē pí
- * \acute{h} ké zēē pí (cf. (15a))

Or, les séquences vocaliques en (10) se comportent comme des monosyllabes et non pas, ni comme des polysyllabes ni comme des suites vocaliques intramorphologiques.

- (17) \acute{h} ká ɲóú díù ɲé 'je vais leur donner un pagne'
 je vais eux pagne donner
- \acute{h} ké ɲué díù ɲé

Non seulement la séquence vocalique subit la règle (8) mais aussi elle la déclenche auprès du morphème qui la précède.

Etant donnée la nature diverse et convergente des preuves que je viens de présenter je me sens justifié de conférer le statut de diphtongues sur les séquences vocaliques de (10).

2.2. Les diphtongues "cachées" /oo/ et /uo/. Ayant établi l'existence des diphtongues en vata il reste à savoir, lesquelles au juste s'y trouvent. J'ai déjà mentionné que la définition (11) semble bien exprimer la gamme des

possibilités. La seule chose qui gâte la sauce, c'est l'inexistence apparente des diphtongues *uo* et *oo*. Dans le reste de cet article je me propose de démontrer que cette lacune n'est qu'illusoire.

2.2.1. Evidence des oppositions du singulier/pluriel. L'évidence la plus importante de l'existence des diphtongues abstraites *uo*, *oo* nous vient de la morphologie nominale. Travis, Doua et Doua [1980] ont discuté la formation du pluriel. Je ne discuterai pas tous les détails de leur analyse. Je me contenterai simplement d'exposer les grandes lignes de l'analyse. Ils ont noté que le pluriel se forme très généralement en remplaçant la dernière voyelle du nom par une voyelle haute, antérieure qui s'accorde avec le reste du radical pour le trait ATR [Travis et al. 1980:2]:

(18) <u>Singulier</u>	<u>Pluriel</u>	
nĩdè	nĩdì	'marmite'
dĩdǎ	dĩdí	'piège'
dĩù	dĩì	'pagne'
gō	gĩ	'queue'
blǎblé	blǎblí	'mouton'
gbǎzà	gbǎzì	'porc-épic'
gbògbò	gbògbì	'cachette'
kpǎ	kpì	'panier de pêche'

A part la règle générale citée ci-haut, Travis et al. ont signalé plusieurs sous-règles impliquées dans la morphologie du pluriel. Par exemple, plusieurs noms se terminant par *-ε*, qui désignent des animaux, prennent *-a* au pluriel:

(19) <u>Singulier</u>	<u>Pluriel</u>	
blé'	blá'	'buffle'
tlē	tlā	'serpent'
nlē	nlā	'animal'
kpē	kpā	'toucan'

Des noms en *-a* ou *-ε* précédés d'une labiale prennent *-o* au pluriel.

(20)	<u>Singulier</u>	<u>Pluriel</u>	
	gbɛ ⁵	gbó	'furoncle'
	vd ⁵	vó	'plaie'
	gbāngbà	gbāngbò	'fourche'
	èlùwà	èlùwò	'chien'

La sous-généralisation vue en (20) figurera dans un argument pour la diphtongue abstraite. Passons maintenant à la considération d'un autre patron.

(21)	<u>Singulier</u>	<u>Pluriel</u>	
	glà'siò	glà'sià	'verre'
	ηótíηótìò	ηótíηótìà	'moustique'
	nōkògbàlìò	nōkògbàlìà	'bois de chauffage'
	dóliò	dólià (var.)	'souris'
	dàdìò`	dàdìà`	'couteau'

Sans exception, les noms se terminant en la diphtongue *ɔ* au singulier prennent la diphtongue *ɔa* au pluriel. Par contre, les noms qui ont une monophtongue finale au singulier ne prennent jamais *ɔ* au pluriel.

(22)	<u>Singulier</u>	<u>Pluriel</u>	
	kpàngò`	kpòngl`	'cheval'
	sō	sī	'bras'
	kpìò	kpì	'panier de pêches'
	glò	glì	'palissade'

Je suis Travis et al. en présumant que les noms en *ɔ* ne manifestent un pluriel en *a* qu'en contexte diphtongal.

Considérons maintenant une forme apparemment irrégulière.

(23)	ko`	koà`	'homme'
------	-----	------	---------

Cette forme nous pose deux questions: je viens de constater que les formes en *ɔ* prennent *a* au pluriel uniquement dans le contexte d'une diphtongue; le singulier semble être monophtongal. D'où vient le *o* du pluriel? Autre-

⁵La sélection de la forme du pluriel implique, parfois, un changement de ton. Voir Travis et al. [1980] pour les détails.

ment dit, étant donné $kɔ'$ au singulier, on s'attendrait à $*kɪ'$ au pluriel.

Je peux répondre à ces deux questions à la fois, en postulant une diphtongue $ɔ$. La forme sous-jacente de $[kɔ']$ sera donc $kɔɔ'$. Ceci explique tout de suite pourquoi nous trouvons $ɔ$ au pluriel: le singulier est bel et bien une diphtongue, et il est la source du $ɔ$ au pluriel; autrement dit, la manifestation en surface du premier élément de la diphtongue. Il nous faut maintenant une règle de monophthongaison pour rendre compte de la forme au singulier.

(24)

$$ɔ \rightarrow \emptyset / \text{Noyau} \begin{array}{l} \diagup \\ \text{---} \\ \diagdown \end{array} \text{ɔ}$$

La règle (24) est l'expression informelle de ce processus. Nous verrons plus tard qu'une formulation beaucoup plus générale est possible, voire nécessaire. La règle contient la structure syllabique dans son contexte car elle ne s'applique qu'aux cas où le $ɔ$ et le ɔ font partie de la même syllabe, autrement dit, qu'à des diphtongues (cf. $lɔ$ 'chanson', $lɔɔ$ 'la chanson', $*lɔ$). Les dérivations pour les formes de (23) sont données ci-dessous.

(25)	<u>Singulier</u>	<u>Pluriel</u>	
	$kɔɔ'$	$kɔɔ'$ + pl.	
	$kɔ'$	$kɔ'$	règle morphologique (24)
	$kɔ'$	$kɔ'$	

Une autre preuve à l'appui de cette analyse est la généralisation que j'ai mentionnée en (20), à savoir que les noms en ε prennent ɔ au pluriel après une labiale. Considérons les formes en (26).

(26)	<u>Singulier</u>	<u>Pluriel</u>	
	$gɔɛ$	$gɔ$	'chimpanzé'
	$lɔɛ$	$lɔ$	'éléphant'

Nous voyons au singulier que le premier élément de la diphtongue $ɔɛ$ peut bien constituer le contexte labial qui conditionnerait la sélection de la forme du pluriel. Cela étant le cas on s'attendrait à $*gɔɔ$ et $*lɔɔ$

comme les formes plurielles de 'chimpanzé' et 'éléphant', respectivement. Or, je peux rendre compte des formes existantes par le biais de la règle (24) qui a été justifiée indépendamment de ces données-ci :

(27)	<u>Singulier</u>	<u>Pluriel</u>	
	gœ	gœ + pl.	
		gó	règle morphologique (24)
	gœ	gó	

Jusqu'à maintenant je n'ai considéré que les diphtongues [-ATR] (œ , ɛɛ , œɛ , ɛɔ , œɔ). Il serait intéressant de passer à leurs homologues [+ATR]. Je commence avec la version [+ATR] ɛɔ déjà étudiée en (21) ci-haut, io .

(28)	<u>Singulier</u>	<u>Pluriel</u>	
	bètió`	bètié`	'bouteille'
	kófiò	kófiè	'singe'
	vlévlíó`	vlévlíé`	'guêpe maçonne'

Nous croyons que la forme du pluriel correspondant à -io au singulier est ie . Je me dois de noter que les données de (28) nous viennent d'un dialecte qui confond e et la dixième voyelle ʌ (voir note 1). Même dans ce dialecte-ci, nous avons les moyens de déterminer de quelle voyelle (e ou ʌ) il est question. Il suffira de prendre la forme définie des pluriels de (28). Si cette forme-là se termine en -εε , il s'agit d'un vrai e . Si, par contre, la forme définie se termine en -ɔɔ ~ ee la voyelle en question est ʌ .

(29)	<u>Indéfini</u>	<u>Défini</u>	
a.	lé	lɛɛ	'lance'
	βlé	βlɛɛ	'boeuf'
	klè	klɛɛ	'chapeau'
b.	slé	sléé ~ slóó	'maison'
	kpē	kpēē ~ kpōō	'chaise'
	gòdè	gòdèè ~ gòdòò	'mortier'
c.	bètié`	bètié`è ~ bètió`ò	'bouteille'

<u>Indéfini</u>	<u>Défini</u>		
kófiè	kófièè	~ kófiòò	'singe'
vlévlíé'	vlévlíé'è	~ vlévlíó'ò	'guêpe maçonne'

Les données en (29) nous montrent que la diphtongue en question est $i\wedge$ et non pas ie .⁶ Ceci dit, il devient évident que les formes de (28) suivent exactement le même modèle que celles de (21) et de (23).

(30) $\text{ɔ} - \text{ɔ} \text{ } \text{ɔ} (= [\text{ɔ}]) - \text{ɔ} \text{ } \text{io} - \text{ } i\wedge (= [\text{ie}])$

Autrement dit, le patron manifesté en (28) n'est que la version [+ATR] du patron en (21).

Jusqu'ici j'ai montré que trois diphtongues subissent le même processus de formation de pluriel: ɔ , ɔ , io . Dans ces trois cas le dernier élément de la diphtongue est remplacé par une voyelle [+bas] dont la valeur du trait ATR est déterminée par la valeur de ce même trait de la diphtongue.

Il nous reste une quatrième possibilité logique de ce genre de diphtongue, à savoir [+ATR] de ɔ .

(31) <u>Singulier</u>	<u>Pluriel</u>	
zòyò	zòyùè ⁷	'oiseau'
yò	yùé	'enfant'
fò	fué	'mort'

Il est important de noter que la diphtongue [ue] du pluriel est $u\wedge$ au niveau sous-jacent. La preuve se trouve encore une fois dans la forme définie de ces pluriels:

(32) zòyùè	zòyùèè	~ zòyùòò
yùé	yùéé	~ yùóó
fué	fuéé	~ fuóó

Les noms se terminant en -o prennent habituellement -i au pluriel, c'est-à-

⁶Cette conclusion est confirmée par des locuteurs qui distinguent toujours e et \wedge . Toutes les formes en (29) sont prononcées $-i\wedge$ par ces locuteurs.

⁷La question du changement de la première voyelle du nom est abordée en Travis et al. [1980]. Elle ne nous concerne pas ici.

dire, qu'ils suivent la règle de formation du pluriel des monophthongues:

(33)	<u>Singulier</u>	<u>Pluriel</u>	
	gō	gĩ	'queue'
	zō	zĩ	'année'
	bló	blí	'plantation'
	gòlò	gùlíf'	'butte'

Nous pouvons rendre compte des formes en (31) en postulant une diphtongue *uo* comme source du *o* au singulier. (Les formes de (33) auront un *o* au niveau sous-jacent). Nous pouvons, donc, expliquer et la présence d'une voyelle basse au pluriel, et l'apparition d'une diphtongue dans ces formes-là. Nous sommes maintenant en mesure de définir la classe des noms prenant une voyelle basse au pluriel.⁸

(34)		Noyau			Noyau		au pluriel
	Si	_____		alors	_____		
			[+arrondi]			[+bas]	

La définition (34) exprime la généralisation que toute diphtongue dont le dernier membre est arrondi, prend une voyelle basse au pluriel. Cette définition ainsi que l'éventail des diphtongues en *vata* (voir (11)) et la contrainte concernant le trait ATR nous donnera les patrons suivants:

(35)	<u>Singulier</u>	<u>Pluriel</u>
	ɔ	ɔ
	oo (= [ɔ])	oo
	io	iʌ (= [ie])
	uo (= [o])	uʌ (= [ue])

Si l'on postule, par exemple *yuò* comme la forme sous-jacente de *yò* (pluriel *yuá*), il faudra une règle de monophthongaison pour que l'on se débarrasse de toute instance de *uo* en surface. En fait, une telle règle a déjà été justifiée dans la phonologie du *vata*. C'est la règle (24) qui a été présentée informellement ci-haut. En généralisant cette règle, ce que je serais obligé de faire de toute façon pour des raisons théoriques, la diph-

⁸La définition à suivre sera un critère suffisant mais non pas nécessaire à la sélection d'une voyelle basse au pluriel. Cf. les formes en (19).

tongue *uo* se transformera automatiquement en *o*. Je donne la version générale de la règle de monophtongaison en (36).

(36) Monophtongaison

[+arrondi] → ø /
 $\begin{array}{c} \text{Noyau} \\ \swarrow \quad \searrow \\ \text{---} \quad \text{---} \end{array}$
 [+arrondi]

La règle (36) transformera *uo*, *oo* en *o*, *o* respectivement, le résultat voulu.

2.2.2. Problèmes résiduels. Je viens de montrer l'existence de deux diphtongues dans la phonologie du vata, qui n'apparaissent jamais en surface. Je poursuivrai cette étude en analysant des problèmes résiduels qui illustrent encore une fois le caractère "abstrait" de la langue. Considérons d'abord le cas en (37).

(37) Singulier Pluriel
 có *cié* 'père'

Ces formes-ci sont intéressantes pour plusieurs raisons. Primo, on voit une diphtongue au pluriel, alors que la forme du singulier a une monophtongue. De plus la sélection de la marque du pluriel s'accorde avec la règle des diphtongues; le suffixe est \wedge (+[e]). Secundo, l'occlusive palatale *c* apparaît devant une voyelle non palatalisante. Or l'apparition de *c* se limite presque toujours à la position devant une voyelle antérieure.⁹

Il serait inutile d'essayer de dériver *có* à partir de *cuó* par le biais de la règle (36). Ceci n'expliquerait ni la forme du pluriel *cié* ni l'occlusive palatale devant une voyelle arrière. Une règle de monophtongaison de *io* sans contexte ne marcherait pas non plus, vu que *io* se manifeste en surface assez régulièrement (cf. les formes de (28)). Je ne peux pas prétendre non plus que toute diphtongue devient monophtongue après une palatale puisqu'au pluriel nous avons *cié*. Je dois me contenter de proposer une règle qui transformera une diphtongue en monophtongue lorsqu'elle est précédée d'une palatale et lorsque son deuxième élément est [+arrondi] (cf. aussi *ció* 'apprendre').

⁹Le nom *có* 'lune' est une des quelques exceptions à cet énoncé.

Cette règle trouve son expression formelle en (38).¹⁰

(38) $[X] \rightarrow \emptyset / [+haut] \text{ --- } \begin{array}{c} \text{Noyau} \\ \swarrow \quad \searrow \\ \text{---} \quad \text{---} \end{array} \quad [+arrondi]$

Cette règle semble être tout à fait ad hoc. En fait, nous verrons tout de suite que son existence est bien justifiée. Si l'on prend la forme définie du pluriel, on peut démontrer une fois de plus que la diphtongue de *cié'* est bel et bien *iá'* au niveau sous-jacent. Ces formes-là manifestent deux variantes se terminant en *-e* ou *-ɔ*. Comme je l'ai dit ci-haut les noms se terminant en *e* (au niveau sous-jacent) prennent *-ɛ* comme la dernière voyelle de la forme définie. Considérons maintenant les formes définies de *cié'* 'pères':

(39) Indéfinie Définie
cié' *cié'è ~ cɔ'ɔ*

La première forme *cié'è* semble tout à fait normale, la voyelle du suffixe étant *-e*. La deuxième forme maintient la voyelle sous-jacente du suffixe tout en assimilant la dernière voyelle du radical.¹¹ Mais la voyelle du radical est devenue monophthongue. Ce résultat découle automatiquement de la règle (38) si l'on suppose que cette dernière règle s'applique après celle d'assimilation qui transforme la voyelle du radical. Nous trouvons donc une justification indépendante pour la règle (38). La dérivation est donnée en (40) ci-bas.

(40) *cié'* *ɔɔ*
cié'ɔ Perte de *ɔ* et assimilation du ton
ci'ɔɔ Assimilation vocalique
cɔ'ɔ règle (38)
[cɔ'ɔ]

¹⁰Cette règle est formulée selon la théorie syllabique de Kaye et Lowenstamm. Le X représente un segment quelconque. Dans cette position syllabique il doit être ou bien une voyelle haute arrondie (à effacer de toute façon par la règle (36)) ou bien une voyelle haute antérieure (qui est l'objet de cette règle). Les seuls segments qui peuvent occuper la position [+haut] de (38) sont *c* et *j*.

¹¹Voir Kaye [1980] pour discussion.

La forme b^{b} est la forme sous-jacente de l'article définie. Il faut aussi proposer une série de consonnes labialisées en vata. Ces consonnes sont des vélares labialisées k^{w} et g^{w} . Elles ne sont pas à confondre avec les diphtongues même si elles sont identiques du point de vue phonétique. Considérons les cas suivants:

(41) a.	<u>Singulier</u>	<u>Pluriel</u>	
	zègwè	zègwì	'agouti'
	tèkwè	tèkwì	'panier'
	b.	<u>Imperfectif</u>	<u>Infinitif</u>
	gwó	gù'	'courir'
	kwó	kwó'	'surveiller'

En (41a) on voit deux noms se terminant en ce qui pourrait être interprété comme des diphtongues. En fait sur le plan phonétique la séquence finale de zègwè est identique à celle de fué (/fuÁ/). Ces noms ne prennent pas la désinence normale du pluriel des diphtongues, à savoir $-\text{A} \sim -\text{a}$. Ils prennent le suffixe qui caractérise les monophthongues: une voyelle haute, antérieure. De plus les formes de (41a) au pluriel comprennent une suite vocalique qui tombe en dehors de notre définition d'une diphtongue en vata (voir (11)).

Les verbes de (41b) manifestent une séquence qui, si analysée comme diphtongue, constituerait un contre-exemple à notre règle de monophthongaison (36). Autrement dit, on s'attendrait à gwó et kwó, kwó' plutôt qu'aux formes de (41b). En outre, il y a aussi la forme gù' à expliquer.

Il est à noter que toutes les formes qui manifestent un comportement comme (41a) et (41b) ont une vélaire qui apparaît immédiatement avant la suite vocalique en question. Alors que nous trouvons des patrons nominaux et verbaux en (41), ceux de (42) sont impossibles.

(42) a.	*bèpwè	*bèpwì	
	*mònwè	*mònwì	
	b.	*swó	*sù'
		*bwó	*bwó'

La manière indiquée pour régler ces problèmes sera de considérer les séquences kw et gw comme des manifestations de deux unités phonémiques: les vélaires labialisées, k^w et g^w. Ainsi les séquences phonétiques [k^wo] et [g^wo] sont /k^wo/ et /g^wo/ et non pas /kuo/ et /guo/. Par conséquent, elles ne subissent pas la règle (36). Enfin, il faut ajouter une règle de délabialisation des consonnes suivies par la voyelle u.

(43) [+cons] → [-labial] / — [+syll
+haut
+arrondi]

La forme gù' est donc dérivée à partir de g^wú'.¹² La règle (43) s'applique, délabialisant la vélaire. La forme de l'imperfectif implique un abaissement de la voyelle ainsi qu'un changement du ton, tous les deux étant déclenchés par le contexte morphologique de l'aspect verbal. Le changement de la voyelle précède la règle (43), règle purement phonologique, tout en l'asséchant. Nous dérivons donc la forme g^wò à l'imperfectif.

3. Conclusion

J'ai tenté, dans cet article, d'offrir des évidences de l'existence de deux diphtongues "abstraites". Dans la mesure où ces preuves sont convaincantes, nous avons encore une fois, une preuve de la nature abstraite de la phonologie. Si nos diphtongues se sont cachées, on peut bien dire que les apprentis de vata sont équipés pour les repérer.

¹²Le ton montant sur gù' est dérivé d'un ton haut par une règle qui ne nous concerne pas ici.

SHONA VERBAL TONES

Kevin G. Donnelly
SOAS, University of London

This paper presents a conditioned variant analysis of the tones on 29 of the most common Shona verbal inflections. After some discussion of perhaps the most detailed previous analysis of Shona verbal tones, that of Fivaz [1970], a summary of the verbal morphology is given. The tonal patterns on the base are then described, followed by those on the pre-base elements. The interaction between the base and the pre-base elements is discussed at length, since it is suggested here that the latter "programme" certain patterns on the former. The effect of the object substitute on the verbal patterns is then described, and some possible advantages of the approach outlined here are mentioned, not least of which is conciseness of description, seen in the checklist of inflections which ends the article.

0. Introduction

Shona (Chishona) is the name given to a cluster of Bantu dialects spoken mostly in Zimbabwe. This paper¹ presents an analysis of the tones on 29 of the most common Shona verbal inflections, both with and without object substitute. The dialect from which the main body of data is taken is Zezuru, spoken around Salisbury, but reference is also made to other dialects, mostly Manyika, spoken in the east of the country.² The method of description

¹My greatest debt of thanks goes to Dr. J.H. Carter for her searching, but always helpful, comments on previous drafts of this paper, which was originally inspired by Dr. D. Fivaz' thesis on Shona morphophonemics (Fivaz [1970] - see also Section 1). I must also acknowledge my gratitude to the Department of Education for Northern Ireland, since it was during the tenure of one of their postgraduate scholarships that I was able to complete the writing of this paper. Thanks to my mother as well, for fine typing from a messy manuscript.

²My sources for the data are listed in the bibliography. The basis for the analysis was the data in the grammar section of Carter and Kahari [1974].

adopted here is a type of conditioned variant analysis, in which certain verbal elements "programme"³ various rules which determine the tone pattern of the verbal base, and in some cases condition tonal realisations elsewhere in the inflection.

1. Fivaz' Analysis

Several other analyses of Shona tones have been proposed, e.g. van Spaandonck [1967], but perhaps the most detailed is that of Fivaz [1970]. This is a taxonomic constituent structure analysis, i.e. the data is described in terms of morphemes which are related to their phonetic realisations by morphophonemic rules (p. xxi). However, Fivaz himself states that there are several problems in this approach and provides a transformational-generative analysis of verbal tones (Appendix II) by way of contrast. The author emphasizes that the interpretation of tonal patterning is of great importance (p.13), but "the main difficulty is that of determining the morphemes that must be recognized in an utterance Are the various different tone sequences 'allos' (i.e. conditioned variants) or 'emes' (i.e. contrastive tonal morphemes)?" (p.14).

1.1. Fivaz' approach. For most of the data he adopts the allomorphic approach, though he notes (fn. p.15) that for some examples "the best way of describing these variations is not in terms of allomorphs but in terms of 'adjustments' to base forms". Where verbal tones are concerned he resorts to the device of "conjugalional morphemes", i.e. morphemes whose realisation is purely tonal and to which the base tones are assigned (p.25). He admits that this

The data in Fortune [in press] and in Fivaz [1970] was used to expand on this, and the dialectal variants described in Stevick [1965] were noted in the analysis where possible, though no sustained attempt was made to work all variants into the analysis as formulated here.

³The term "programme" implies that a pre-base element may specify a certain tone-pattern on the base: if there is a change in the status of the pre-base element, e.g. by addition of the features [+third person] or [+participial] (see sections 5.1 and 5.2), or a change in the combination of the pre-base elements, e.g. by addition of an object substitute (see sections 8 and 9), then there is a resultant direct change in the pattern on the base.

is unsatisfactory for three reasons: (a) Eleven ('ten' on p.139) such morphemes must be recognised, but it is impossible to attribute any sort of consistent "meaning" to these forms. There are also no verb forms which contrast solely on the basis of these morphemes. In what sense are they then "morphemic"?... (b) ... there is considerable overlap between the various tonal morphemes ... In what sense are these morphemes 'contrastive'? ... (c) ... If the different tone-sequences are *dependent* on [the tone-class of the radical, the pre-base elements, the mood of the inflection] then they cannot be realisations of various morphemes, which are, by definition, contrastive (pp.34-5).

1.2. Fivaz and autonomous tonal grammar. Fivaz also gives some consideration to "autonomous tonal grammar" (cf. Cole [1969]), i.e. "the possibility of assigning all tonal sequences to morphemes whose realisation is only tonal" (p.16). But in Appendix I he gives reasons against such an approach and concludes that it would be both "theoretically unjustifiable and empirically unsupported".

1.3. Fivaz and conditioned variant analysis. As for conditioned variant analyses, he says that his interpretation of the base tones as tonal replacement morphemes "is clearly the simplest taxonomic treatment, as the alternative analysis, that of treating the different sequences as conditioned variants, requires a morphophonemic statement of extreme complexity" (p.21). He reiterates that this "would require complex distributional statements in terms of morphological and syntactic features" (p.34). Yet on p.35 he admits that base tones seem to be conditioned "in a rather complex and perhaps unusual way" by other features in the verbal inflection. We might note, however, that a conditioned variant analysis would have none of the drawbacks he himself cites with regard to the conjugational morpheme approach. I also hope to demonstrate to some extent in this paper that for at least some areas of the verbal system a conditioned variant analysis is not quite as complex as might appear at first sight. For example, Fivaz believes that conflation of base patterns l/hl/hlh/hhlh and h/hl/hlh/hhlh "would require complex conditioning statements" (fn. 3, p.142), with the same comment as regards conflation of l/lh/lhl/lhhl and h/lh/lhl/lhhl (fn., p.144). But, as I will try to show in section 11, these four variants can be handled by two adjustment rules together with, for the dialect in this paper at least, a fairly

simple statement of distribution.⁴

2. Shona Verbal Inflections

2.1. Outline of inflectional pattern. We may say that Shona verbal inflections have the following pattern:

$$\left. \begin{array}{l} \text{hort.} \\ \text{neg.} \end{array} \right\} +\text{SP} \pm \text{neg.} + \text{TM} \pm \text{neg.} + \text{VI} \pm \text{OS} + \text{R} \pm \text{ext.} + \text{TV}$$

(where hort. = hortative element; neg. = negative element; SP = subject prefix; TM = tense marker; VI = verbal infix; OS = object substitute; R = radical; ext. = verbal extension; TV = terminal vowel)

However, the sequence ... + TM is replaced in the infinitive by ku- (the class 15 nominal prefix), in the imperative by zero, and in the subjunctive by SP. Overlying this morphological sequence is a tonal pattern, varying with mood and tense, and quite often also with reference to whether the form is third person or first/second person. There are seven tenses (future, near future, present, past of today, past of before today, imperfect, potential) and eight moods, three tense-linked (indicative, relative, participial), occurring on the tenses listed above, and five independent (infinitive, consecutive, imperative, subjunctive, hortative). For glosses and structure of these inflections see section 14.

2.2. Features. Features required for the description are: third person or class [+3] (where an inflection is specified as [-3] it will of course automatically mean that it is first or second person), participial [+part], relative [+rel], subjunctive [+subj], imperative [+imp]. It has been usual to say that, for example, the tone pattern associated with a verbal inflection referring to a third person subject, as against the tone pattern associated with a verbal inflection referring to a first/second person subject, is conditioned by the appearance of a third person morpheme. For the purposes of this paper, however, I prefer to say that *both* the tone pattern *and* the appearance of the third person morpheme are the realisation of a more abstract feature [+3].

⁴In actual fact, all of Fivaz' data seems to employ the adjustment rule sequence 10,11,7.

3. Classes of Radical

Shona radicals are divided into two distinct classes. We will account for this by saying that one class of radicals has a "determiner" (D) on the first syllable of each radical and will call these D radicals, while the other class of radicals has no such D and will be called "neutral" (N) radicals.⁵ We will then have D radicals such as -d_- 'love', -tor- 'take', -tenges- 'sell', -batsir- 'help', and -kanganis- 'make a mistake' and N radicals such as -ti 'tell', -bv- 'come from', -end- 'go', -ramb- 'refuse', -taur- 'speak', -takur- 'carry', -nyemwerer- 'smile', and -rondedzer- 'prepare [things] for'. (Determiners are underlined.)

4. Base Patterns

The sequence R ± ext. + TV is called a "base". A number of differing tone patterns may occur on this base, programmed, as mentioned above, by verbal elements elsewhere in the inflection. Nevertheless, it is important to remember that there is a tonological boundary between the base and the other inflectional elements preceding it, even if one of these elements has programmed the pattern on the base. The various base patterns will now be exemplified from inflections, the tonological boundary between the base and the pre-base elements being indicated by a full stop. Tone patterns on these pre-base elements should be disregarded for the time being.

⁵The concept of determinant and neutral elements was developed by Meeussen (see, for example, Meeussen [1963]) and refined by Carter [1971-2]. In the morphotonemic analysis they proposed, they sought to account for the various tonal patterns of Tonga by positing an underlying distinction in syllable status which was not immediately obvious from an examination of the surface patterns. They suggested a two-way distinction: syllables behaving in a certain way they labelled "determiners" and syllables not behaving in that way they labelled "neutrals". The underlying sequence of determiners and neutrals was related to the surface patterns by a series of realisation rules. There was a broad relationship between surface high tone and underlying determiner, and between surface low tone and underlying neutral, but this was by no means always the case; a sequence determiner-determiner, for example, usually surfaced as high-low. In this article the concept of determiner and neutral has been taken over, though the realisation rules proposed here (see section 6.1) are slightly different from those proposed for Tonga.

4.1. The reference pattern.

Let the reference pattern X be, e.g. consecutive, 'and I loved', etc.

D bases	N bases	D bases	N bases
h	1	ndika.dá	ndika.bva
hh	11	ndika.tórá	ndika.enda
hhh	111	ndika.téngésá	ndika.taura
hhhl	1111	ndika.kángánísa	ndika.nyemwerera

(where h is high tone, marked ' , and l is low tone, unmarked)

The reference pattern occurs automatically on underlying forms.

4.2. Adjustment rules. Other patterns are derived from X by "adjustment rules", and further patterns may be derived from these patterns in turn by the application of other adjustment rules.⁶ There seems to be only one instance where the sequence of application of these rules is of importance inside one particular dialect (see section 4.4). However, there is also some evidence that sequence of application may be relevant where dialectal variants are concerned (see the discussion in section 6.5). Otherwise, it seems that the rules should be applied in the order given (with the exception of rules 6 and 7). For a list of the rule sequences actually occurring, see section 14. In the following list of adjustment rules, → is short for "the application of this rule adjusts the pattern on the left to become the pattern on the right", and a number in brackets is short for "the product of the application of the rule with this number to the reference pattern". The words "raise" and "lower" can by definition apply only to syllables which are, respectively, low and high.

⁶Earlier drafts of this paper described the base patterns in terms of several pairs of patterns occurring respectively on D and N radicals, rather like Fortune's tone conjugations. Although in some ways these were easier to fix in the mind than the present rule sequences, it was felt that deriving the various patterns by rules from one reference pattern would have advantages of descriptive adequacy when comparing data from different dialects, since it is easier to write a new rule or rewrite the existing ones than it is to introduce another tone conjugation, which would in any case probably differ only minimally from the ones already established. See section 14 for examples of dialects applying slightly different rule sequences.

A.R.1: Raise the first syllable of the base.

X → h	h	e.g.	ndichí. <u>dá</u>	ndichí.bvá
hh	hl		ndichí. <u>tórá</u>	ndichí.éndá
hhh	hll		ndichí. <u>téngésá</u>	ndichí.táúra
hhhl	hlll		ndichí. <u>kángánísa</u>	ndichí.nyémwerera
			present participial, 'I loving', etc.	
			(some Eastern dialects, according to Stevick [1965])	

(9) → h	h	e.g.	nda. <u>dá</u>	nda.bvá
hl	hl		nda. <u>tórá</u>	nda.éndá
hll	hll		nda. <u>téngesa</u>	nda.táúra
hlll	hlll		nda. <u>kánganisa</u>	nda.nyémwerera
			past of today, 'I loved', etc.	

A.R.2: Raise the second syllable of N bases.

(1) → h	h	e.g.	ndichí. <u>dá</u>	ndichí.bvá
hh	hh		ndichí. <u>tórá</u>	ndichí.éndá
hhh	hhl		ndichí. <u>téngésá</u>	ndichí.táúra
hhhl	hhll		ndichí. <u>kángánísa</u>	ndichí.nyémwérera
			present participial, "I loving", etc.	

A.R.3: Lower the second syllable of disyllabic N bases.

(1) → 2 → h	h	e.g.	kumú. <u>dá</u>	kumú.tí
hh	hl		kumú. <u>tórá</u>	kumú.rámba
hhh	hhl		kumú. <u>bátsírá</u>	kumú.tákúra
hhhl	hhll		kumú. <u>kángánísa</u>	kumú.róndédzera
			infinitive +OS, 'to love him', etc.	

A.R.4: Raise all except the first syllable on N bases.

X → h	l	e.g. plus	i. <u>dá</u> *	i.bvá*
hh	lh	A.R.7 ⁷	<u>tórá</u>	endá

⁷There are no examples in my data of A.R.'s 4 and 5 without accompanying application of A.R.'s 6 or 7. The inflections given as examples for these

hhh	lhh	t <u>é</u> ngésá	taúra
hhhl	lhhh	k <u>á</u> ngánf <u>s</u> a	nyemw <u>é</u> ré <u>r</u> á

imperative, 'love!' etc.
 (* i- is a euphonic vowel prefixed before monosyllabic bases)

A.R.5: Lower the last syllable of 3/4-syllable N bases.

(4) → h	l	e.g. plus	hand <u>í</u> .de	hand <u>í</u> .bve
	hh	A.R.6 ⁷	hand <u>í</u> .t <u>ó</u> ré	hand <u>í</u> .endé
	hhh		hand <u>í</u> .t <u>é</u> ngésé	hand <u>í</u> .taúre
	hhhl		hand <u>í</u> .k <u>á</u> ngánf <u>s</u> e	hand <u>í</u> .nyemw <u>é</u> ré <u>r</u> e

present negative, 'I do not love', etc.

A.R.6: Lower monosyllabic bases, e.g. see under A.R.5.

A.R.7: Raise monosyllabic bases, e.g. see under A.R.'s 4 and 11.

A.R.8: Lower last high of D bases.

(1) → l	h	e.g.	nd <u>í</u> .de	nd <u>í</u> .bvé
	hl		nd <u>í</u> .t <u>ó</u> re	nd <u>í</u> .éndé
	hhl		nd <u>í</u> .t <u>é</u> ngése	nd <u>í</u> .taúre
	hhll		nd <u>í</u> .k <u>á</u> ngánf <u>s</u> e	nd <u>í</u> .nyémw <u>é</u> rerere

subjunctive, 'that I may love', etc.
 (some dialects - Stevick)

A.R.9: Lower D bases.

X → l	l	e.g.	ng <u>á</u> a.de	ng <u>á</u> a.bve
	ll		ng <u>á</u> a.t <u>ó</u> re	ng <u>á</u> a.ende
	lll		ng <u>á</u> a.t <u>é</u> ngese	ng <u>á</u> a.taure
	llll		ng <u>á</u> a.k <u>á</u> ngánf <u>s</u> e	ng <u>á</u> a.nyemw <u>é</u> rerere

hortative, 'let him love', etc.

two rules, therefore, include the later application of rules 6 or 7. The hypothetical form for *i.bvá* in A.R.4 would be **i.bva*, but application of rule 7 makes this *i.bvá*; likewise, the hypothetical form for *handí.de* in A.R.5 would be **handí.dé*, but application of rule 6 makes this *handí.de*.

A.R.10: Replace X by the pattern lhlh on all bases.

X → l	l	e.g.	ndísingamú.de	ndísingamú.ti
lh	lh		ndísingamú.toré	ndísingamú.rambé
lhl	lhl		ndísingamú.batsíre	ndísingamú.takúre
lhlh	lhlh		ndísingamú.kangánisé	ndísingamú.rondédzeré

present negative participial +OS, 'I not loving him', etc. (some Eastern dialects - Stevick [1965])

A.R.11: Bring the first high of A.R.10 into line with the determiner on D bases. Spread the first high over two syllables on 4-syllable bases.

(10) → h	l	e.g. plus	ácha.dá	ácha.bvá
hl	lh	A.R.7	ácha.tóra	áchá.endá
hhl	lhl		ácha.téngesá	áchá.taúra
hhhl	lhlh		ácha.kángánísá	áchá.nyemwéréra

future participial, 'he being about to love', etc.

A.R.12: Replace the sequence lhhl by lhll, and the sequence lhhh by llhh. (Fivaz' dialect)

e.g. áchá.nyemwéréra (cf. under A.R.11) → áchá.nyemwérera
nyemwérérá (cf. under A.R.4) → nyemwérérá

4.3. Frequency of adjustment rules. Some of these rules, e.g. 4,5, are not all that frequently used, but the others appear in a variety of inflections. Some sequences, such as 1, 2, 3, or 10, 11, 6/7 are very common indeed, the latter occurring on most participials, and both commonly occurring on inflections +OS.

4.4. Adjustment rules and ordering. There is one interesting instance of rule sequence being correlated with the difference between [-3] and [+3]. This occurs in the indicative of the past of today (recent past, see section 14.6).

[-3] applies the rules 9 and then 1 to give the base pattern (cf. under A.R.1).

h	l	$\begin{matrix} \rightarrow \\ 9 \end{matrix}$	l	l	$\begin{matrix} \rightarrow \\ 1 \end{matrix}$	h	h
hh	ll		ll	ll		hl	hl
hhh	lll		lll	lll		hll	hll
hhhl	llll		llll	llll		hlll	hlll

[+3] applies the rules 1 and 9

h	l	$\begin{matrix} \rightarrow \\ 1 \end{matrix}$	h	h	$\begin{matrix} \rightarrow \\ 9 \end{matrix}$	l	h
hh	ll		hh	hl		ll	hl
hhh	lll		hhh	hll		lll	hll
hhhl	llll		hhhl	hlll		llll	hlll

For example, *nda.tórá 'I took' $\begin{matrix} 9 \\ \rightarrow \end{matrix}$ nda.tora $\begin{matrix} 1 \\ \rightarrow \end{matrix}$ ndatóra
 *nda.énda 'I went' $\begin{matrix} 9 \\ \rightarrow \end{matrix}$ nda.énda $\begin{matrix} 1 \\ \rightarrow \end{matrix}$ ndaénda
 *á.tórá 'he took' $\begin{matrix} 1 \\ \rightarrow \end{matrix}$ á.tórá $\begin{matrix} 9 \\ \rightarrow \end{matrix}$ átóra
 *á.énda 'he went' $\begin{matrix} 1 \\ \rightarrow \end{matrix}$ á.énda $\begin{matrix} 9 \\ \rightarrow \end{matrix}$ áénda

5. Pre-base Elements

Having dealt with the various possible base patterns, we may now move on to the rather more complex field of the pre-base elements, starting with three general comments and then setting out the behaviour and programming potential of the elements themselves.

5.1. The indicative SP. An indicative inflection [+3] always has a determiner on the subject prefix syllable, e.g.

ndicháénda 'I will go' but ácháénda 'he will go'
 [-cha- [+3] \rightarrow -chá- ; cf. section 7]

ndatóra 'I took [today]' but átóra 'he took [today]'

5.2. The participial SP. An inflection [+part] always has a determiner on the subject prefix syllable (with the exception of inflections containing the present participial element -chí-), e.g.

ndinóénda 'I go' but [zva-] ndínóénda '[when] I go'
 [-no- [+part] \rightarrow -nó- ; cf. section 7]

ndakátóra 'I took [before today]' but ndákátóra 'I having taken'
 [-a-ka- [+part] \rightarrow -a-ká- ; cf. section 7]

but

ndichíéndá 'I going', ndichítórá 'I taking'

5.3. The direct relative. A direct relative inflection having the same morphological structure as the indicative will have the same tone pattern as the indicative [-3] (with the exception of inflections containing the past of today element -a-), e.g.

ndingátengesa 'I would be able to buy'
 and ángaténgésá 'he would be able to buy'
 but angátengesa 'he who would be able to buy'

ndaítaura 'I used to speak'
 and áitaura 'he used to speak'
 but aitaura 'he who used to speak'

With the past of today most dialects have a rule change in the relative: where the indicative [-3] has rule sequence 9,1, the direct relative will have sequence 9,1,2, or sometimes sequence 1,2, e.g. Fivaz. (The cluster of rule sequences associated with this tense is a particularly interesting one, cf. section 4.4).

ndatóra 'I took', ndaénda 'I went' - sequence 9,1
 but ndatóra 'I who took', ndaénda 'I who went' - sequence 9,1,2
 or ndatóra 'I who took', ndaénda 'I who went' - sequence 1,2

Some dialects, however, do retain the indicative [-3] sequence 9,1:

ndatóra 'I [who] took', ndaénda 'I [who] went' - sequence 9,1

6. Status of Pre-base Elements

As for the elements themselves, we must remember that there is a tonological boundary between them and the base (see section 4); in the following examples, therefore, tone patterns on the base should be disregarded for the time being. Pre-base elements, which are all taken as being monosyllabic, have four different types of status: they may be determiners (symbolised by underlining), neutral (no marking), post-sensitive (marked by subscript _^) or radical-sensitive (marked by subscript _↳).

6.1. Realisation of determiners and neutrals. Single elements with a deter-

miner are realised with high tone, whereas single neutral elements are realised with low tone, e.g.

ndí.téngésé 'that I may buy' but ku.taúra 'to speak'

Neutral elements before a determiner are also realised with low tone, as is a succession of neutral elements, e.g.

ndinó.tórá 'I take', ndikasa.énda 'and I did not go'

In other words, $D \rightarrow h$ and $N \rightarrow l$. However, a determiner following a determiner is realised with low tone unless it is followed by another determiner, and a neutral element following a determiner has a high ("echo") tone unless it is followed by another determiner. A neutral element following two determiners is realised with low tone. In other words, $DD(N) \rightarrow hl(1)$; $DN(N) \rightarrow hh(1)$; $DDD \rightarrow hhh$; $DND \rightarrow hlh$. Or, more formally, $DD \rightarrow hl / _\emptyset, __N$; $DD \rightarrow hh / __D$; $DN \rightarrow hh / _\emptyset, __N$; $DN \rightarrow hl / __D$; otherwise $D \rightarrow h$, $N \rightarrow l$.

áno.tórá 'he takes'
 ndísinga.éndé 'I not going' [some central dialects]
 ásisámu.bátsiré 'he not being about to help him'
 ása.tóré 'that he may not take'
 ndísinga.éndé 'I not going' [eastern dialects]
 ndísisá.taúre 'I not being about to buy'

6.2. The depressor rule. There seem to be two instances of a very restricted "adaptation-rule", which is applied nearer the surface than the other realisation rules described. It occurs only in the imperfect negative and the imperfect participial when they contain an OS and will be referred to as the "depressor-rule", since it states that "the high tone of the element is replaced by low tone when a depressor consonant follows".⁸ The elements in question, the OS of the two inflections mentioned, are determiners, but they will be marked with subscript ... to show the application of this rule.

handáimú.tákúra 'I did not use to carry him'

⁸Depressors in Shona are as follows (given in the current official orthography): bh, dh, g, vh, mh, nh, z, zh, zv, j, dy, rw, h, or any consonant cluster containing them.

handáiri.dz'ívuúra	'I did not use to unstopper it'
áimú.báts'írá	'he being used to help him'
áimú.bhádhúra	'he being used to slap him'

6.3. Post-sensitive elements. "Post-sensitive" elements depend on the *following syllable* for their tonal realisation: if that syllable has high tone, the element has low tone; if it has low tone, the element has high tone. These unassigned elements occur only immediately before the radical, and mostly in participials and inflections +OS.

áká.taúra	'he having spoken'
áká.téngesá	'he having bought'

6.4. Radical-sensitive elements. "Radical-sensitive" elements have low tone when preceding a D radical and high tone when preceding an N radical. Apart from one or two dialectal variants, they occur in Zezuru only in the past of before today, future, and potential tenses [+3].

áká.tórá	'he took'
áká.énda	'he went'

6.5. Elements of ambiguous status. We must note that in certain cases there are only minimal differences in the status of certain elements, i.e. we may have to decide their status on the basis of only one tone in a whole inflectional paradigm. See, for example, the present tense as used in the indirect relative:

-ndínodá	'[when] I love'	-ndíno [*] bvá	'[when] I come from'
-ndínotóra	'[when] I take'	-ndínoéndá	'[when] I go'
-ndínoténgesá	'[when] I buy'	-ndínotáúra	'[when] I speak'
-ndínokángánísá	'[when] I forget'	-ndínónyemwéréra	'[when] I smile'

It is plain that whether we class the element -no- as -no^{*}- or as -no_↳- depends merely on what tone the syllable marked with an asterisk has; if it is low (as in the dialect from which most of the data here is taken) we will have -no^{*}-, but if it is high (as in Fivaz' dialect - p.133) we will have -no_↳-. The same phenomenon occurs in other instances.

What are the implications of this? It could, of course, mean that the

description is at fault, when it seems to magnify this very small difference by giving two distinct statuses to the -no- element. Both of these statuses are, moreover, 'secondary' to the basic determiner/neutral distinction. Yet I think we have good reason to welcome such cases as this. Just as base patterns are due to the application of slightly different rule sequences in different dialects, we see here that the behaviour of the pre-base elements likewise depends on very slight differences. This in turn suggests that with more data we may be able to abstract an underlying form for these various types of dissimilation or polarity, which on the surface appear so difficult to reconcile with each other.

In this instance, for example, there is an interesting possibility of describing the data in terms of a type of ordering in the surfacing of the various rules and features, so that we need describe the element -no- only as post-sensitive. The basic adjustment rules applied in this particular inflection (see section 14.1) are 10, 11, and 7 (Fivaz' dialect has the additional rule 12). If we use ps, standing for "post-sensitive", to mean "the element takes tone opposite to that of the succeeding syllable", and the plus sign to indicate "application of the following rule", we can very roughly sketch out two derivations for the -ndinobva form on which the discussion centres (no attempt has been made to reflect different "levels" by different orthographic conventions):

$$\begin{array}{l}
 \text{ndi.no.bva} + (D \rightarrow h) \rightarrow \text{ndí.no.bva} + (10) \rightarrow \text{ndí.no.bva} + (11) \rightarrow \\
 \text{ndí.no.bva} \left\{ \begin{array}{l} + (7) \rightarrow \text{ndí.no.bvá} + (\text{ps}) \rightarrow \text{ndínobvá} \\ + (\text{ps}) \rightarrow \text{ndí.nó.bva} + (7) \rightarrow \text{ndínóbvá} (\text{F}) \end{array} \right.
 \end{array}$$

Thus, where A.R.7 is applied *before* the post-sensitive rule, we have -no- appearing as -no- (post-sensitive) throughout the whole series, but when A.R.7 is applied *after* the post-sensitive rule, we have -no- appearing as -no- (radical-sensitive) throughout the whole series. It would seem, from examination of other inflectional formulae, that it is more usual for all the adjustment rules to be applied at the same stage, but it is interesting that splitting the application into two parts deals so neatly with two dialectal variants, as well as making a connection between two seemingly dif-

ferent types of element behaviour.

This may be a suitable place to draw attention to another instance of an element having two possible statuses. This is in the past of today [-3] +OS (see section 14.6).

ndamúda	'I loved him'	ndamúti	'I told him'
ndamútorá	'I took him'	ndamúramba ,.	'I refused him'
ndamúbatsira	'I helped him'	ndamútakura	'I carried him'
ndamúkanganisa	'I forgot him'	ndamúrondedzera	'I prepared [things] for him'

Here we have the choice of classifying the OS as a determiner, or as post-sensitive. When we consider the [-3] form for Eastern dialects (OS), and the [+3] forms (OS), we might wish to describe the OS here as a determiner. But looked at from the point of view of concise classification of OS behaviour in the dialect from which the main body of the data here is taken, we might like to class together the behaviour of the OS before "minority" sequences for +OS inflections (9 (as here) and 4, 5, and 6) and describe the OS as post-sensitive (see section 9.1). We thus have a choice here of how to describe the element in question, but again, this does not necessarily mean that the terms of analysis are ill-founded or unjustified, and in fact it is worth noting that this tense is one in which sequence of rule application is of great importance (see section 4.4 and 5.3).

Taking the comments in this section as a whole, we may speculate whether it might be justifiable to posit some sort of connection between rule ordering and the status of pre-base elements.

7. Programming Potential

It may be useful now, as a summary, to list all the pre-base elements in terms of their "programming potential", that is, the adjustment rule sequences applied to the verbal base when the element in question is present in the inflection. We may distinguish two "series" of pre-base elements - one in which the element may change its status (and consequently its programming potential, i.e. the adjustment rules it programmes) due to the addition of the feature [+3] or [+part], and one in which these features are not added and have therefore no effect on the status of the elements. We may call

the first group Series I and the second group Series II. It should be noted, though, that a few Series II elements, such as *-sa-*, do have their status altered by other features such as [+imp].

In the following table dialectal variants (listed on different lines, or separated by colons) are given where possible and are noted by a letter in parentheses after the variant. F refers to Fivaz' dialect, E to eastern dialects in Stevick [1965], and S to southern dialects in Stevick [1965]. Other variants given are also from Stevick [1965], but he gives no characterisation of their particular area.

Series I

Citation form	[+3]	[+part]	programmes adjustment rules (commonest sequence given first)
<u>-no-</u>			X; 1 (E); 1, 2, 3 (S)
	<u>-no-</u>		X
	<u>-no-</u> (E)		X
	<u>-no-</u> (S)		1, 2, 3
		<u>-no-</u>	10, 11, 7
		<u>-no-</u> (F)	10, 11, 7, 12
<u>-i-</u>			X; 1 (E); 1, 2, 3 (S)
	<u>-i-</u>		X
	<u>-i-</u> (E)		X
	<u>-i-</u> (S)		1, 2, 3
		<u>-i-</u>	X
<u>-cha-</u>			1, 9; 1 (E); 1, 2, 3 (S)
			<u>-cha-/ha-</u> (neg.)___ : 10, 11, 6
	<u>-cha-</u>		1, 2, 3; 1 (F)
	<u>-cha-</u> (E)		X
		<u>-cha-</u>	10, 11, 7
		<u>-cha-</u> (F)	10, 11, 7, 12
			(This behaviour and potential is shared by the elements <u>(-a)-ka-</u> [past of before today] and <u>-nga-</u> [potential])
<u>-a-</u>			9, 1; 1 (E)
			<u>-a-</u> [+rel] : 9, 1, 2; 1, 2 (F) (E)

Citation form	[+3]	[+part]	programmes adjustment rules
	<u>-a-</u>		1, 9; 1 (E)
		<u>-a-</u>	10, 11, 6; 10, 11, 7, 12 (F), 10 (some E)
	<u>-o-</u>		1, 9; 1 (E) [note: [+3] forms do not differ from [-3] (citation) forms]
		<u>[-o-]</u>	10, 11, 6; 10, 11, 7, 12 (F)

Series II

Citation form	programmes adjustment rules
ku-	X
-ka-	X
-chi-	1, 2; 1
nga/ha-	9 + assignment of D to the SP; 1, 8
[+imp]	4, 7; 4, 7, 12 (F)
	[+imp] + <u>-sa-</u> : 1, 2; 1
[+subj]	1, 2 + assignment of D to the SP; 1, 8 + assignment of D to the SP
	[+subj] + <u>-sa-</u> (some dialects) : 1, 2, 3
-sa-	does not programme, i.e. does not alter patterns already programmed by another element
	-sa- [+imp] → <u>-sa-</u>
	-sa- [+subj] → <u>-sa-</u> (some dialects)
ha-	4, 5, 6 + assignment of D to the SP; 4 + assignment of D to the SP
	ha- / ___ <u>-i-</u> : X
	ha- / ___ <u>-cha-</u> : 10, 11, 6; 10, 11, 7, 12 (F)

Most of these elements and sequences have been exemplified in preceding sections, but to clarify what is meant, we can examine two elements, -no- and nga-/ha-, in greater detail, using the trisyllabic bases -tengesa 'buy' and -takura 'carry'.

7.1. The present tense. The present tense element has the [-3] (citation) form -no-, and it programmes the reference pattern X in Zezuru, the dialect from which the main body of data is taken. However, according to data in Stevick [1965], it programmes A.R.1 in eastern dialects and A.R.1,2,3 in

southern dialects. We thus have, for 'I buy' and 'I carry' respectively,

ndinó <u>t</u> éngésá	ndinó <u>t</u> akura	Zezuru dialect
ndinó <u>t</u> éngésá	ndinó <u>t</u> ákura	eastern dialects
ndinó <u>t</u> éngésá	ndinó <u>t</u> ákúra	southern dialects

When the feature [+3] is present, -no- continues to programme X in Zezuru. In the eastern dialects it changes its status from determiner to post-sensitive and programmes X (comparable to Zezuru but differing from its earlier programming potential of A.R.1 when [-3]). In the southern dialects -no- changes its status from determiner to radical-sensitive and programmes A.R.1,2,3 (as it did when [-3]). Thus, for 'he buys' and 'he carries',

ánó <u>t</u> éngésá	ánó <u>t</u> akura	Zezuru dialects
ánó <u>t</u> éngésá	ánó <u>t</u> ákura	eastern dialects
ánó <u>t</u> éngésá	ánó <u>t</u> ákúra	southern dialects

It is to be noted that for the D base -tengesa the surface realisation is the same in all three cases. The realisations for the N base -takura are, however, very different. It was considered best to give a tense formulation for both bases in each dialect, in the hope that these formulations can later be related to each other (see section 6.5), rather than give one formulation for D bases throughout the Shona area and another for N bases. Such formulations would, it seems certain, be much more difficult to relate, and would probably make the analysis too complicated.

When the feature [+part] is present, the -no- element changes its status from determiner to post-sensitive in Zezuru and programmes A.R.10,11,7 (a common participial sequence). Insufficient information on the [+part] patterns of eastern and southern dialects is given in Stevick [1965], so we can give no formulation here for these dialects. However, Fivaz' dialect, which usually agrees with Zezuru, here diverges; in his dialect the element changes its status from determiner to radical-sensitive and programmes A.R.10,11,7,12. Thus, for '[when] I buy' and '[when] I carry',

-ndínó <u>t</u> éngésá	-ndínó <u>t</u> ákúra	Zezuru dialect
-ndínó <u>t</u> éngésá	-ndínó <u>t</u> ákúra	Fivaz' dialect

In this case the two realisations are the same, showing that the differences are very slight between the two dialects, and that we may be able to reduce -nɔ̃- and -nɔ̃- to one underlying form (see section 6.5). N bases of a different length do, however, show a difference in realisation:

-ndínɔ̃bvá	-ndínónyemwéréra	Zezuru dialect
-ndínóbvá	-ndínónyemwérera	Fivaz' dialect
'[when] I come from'	'[when] I smile'	

7.2. The hortative. The hortative element has two possible morphological forms, nga- or ha-. We will use nga- in these examples. In Zezuru, nga- programmes A.R.9 and assigns a determiner to the subject prefix. In another dialect (unspecified) in Stevick [1965], it programmes A.R.1,8 (and does not assign a determiner). Thus, for 'let me buy' and 'let me carry',

ngánditengese	ngánditakure	Zezuru dialect
ngándíténgése	ngándítákure	other dialects

In Zezuru, the negative hortative is formed by the insertion of the negative element -sa-, which does not programme, i.e. does not alter patterns already conditioned. Thus, for 'let me not buy' and 'let me not carry',

ngándisatengese	ngándisatakure
-----------------	----------------

7.3. Summary. It is hoped that these examples show how useful the analysis may be in dealing with dialectal variants and how succinctly it may express the patterns of whole inflections. This section has dealt with inflections from the point of view of the pre-base elements and their programming potential. Section 14 gives a fuller listing of inflectional patterns seen as a whole, including pattern behaviour when the inflection contains an object substitute. It is to this latter situation that we will now turn our attention.

8. Base Patterns and Object Substitutes

The insertion of an object substitute into the inflection is accompanied in most cases by the application of new adjustment rules governing the base tones:

(1)	X	is replaced by	}	1, 2, 3
	1, 2 (-chi-)	" " "		
	1, 9	" " "		
	1, 2, 3	remains		
(2)	9, 1	is replaced by		9
(3)	9	is replaced by	}	10, 11, 6
	1, 2 ([+subj])	" " "		
	4, 7	" " "		
	10, 11, 7	" " "		
	10, 11, 6	remains		
(4)	4, 5, 6	remains		4, 5, 6
(5)	1	"		1
(6)	4	is replaced by		10, 11

The last two are less common patterns given by Stevick. Two examples will be sufficient to show what is meant here. The feature [+imp] programmes adjustment rules 4 and 7; when, however, an object substitute (OS) is present, the adjustment rules 10, 11 and 6 are applied instead (for the tones on the OS itself, see section 9):

D bases

i.dá	'love!'	→	mú.de	'love him!'
tórá	'take!'	→	mú.tóre	'take him!'
bátsírá	'help!'	→	mú.bátsiré	'help him!'
kángánísa	'forget!'	→	mú.kángánisé	'forget him!'

N bases

i.bvá	'come from!'	[→]	mú.ti	'tell him!'
rambá	'refuse!'	→	mú.rambé	'refuse him!'
takúra	'carry!'	→	mú.takúre	'carry him!'
rondédzérá	'prepare things for!'	→	mú.rondédzére	'prepare things for him!'

Likewise, the element -cha- [-3] programmes A.R.1,9, but when an OS is present, A.R.1,2,3 apply instead. Thus, for D bases:

ndicháda	'I will love'	→	ndichámu.dá	'I will love him'
ndichátora	'I will take'	→	ndichámu.tórá	'I will take him'
ndichábatsira	'I will help'	→	ndichámu.bátsírá	'I will help him'
ndichákanganisa	'I will forget'	→	ndichámu.kángánísa	'I will forget him'

9. Behaviour of the Object Substitute

An OS occurring before the base pattern assembled by the application of these new adjustment rule sequences exhibits the following tonal behaviour.⁹

9.1. Before sequences 9 and 4, 5, 6. An OS occurring with the sequence 9 or with the sequence 4, 5, 6 is post-sensitive, e.g. ndamútakura 'I carried him', ndamúbatsira 'I helped him' [sequence 9]; haámútakúre 'he is not carrying him', haámubátsíré 'he is not helping him' [sequence 4, 5, 6].

9.2. Before sequence 1, 2, 3. An OS occurring with the sequence 1, 2, 3 is a determiner, e.g. ndómubátsírá 'I will soon help him', ndómútakúra 'I will soon carry him'. The depressor rule (see section 6.2) applies (i) when the OS is preceded by the element $-j-$, i.e. the element $-j-$ with feature [+part] (see sections 7 and 10 (ii)); (ii) when the OS is preceded by the element $-j-$ co-occurring with the negative element ha- (see section 10 (i)). For examples see section 6.2. But it is neutral when preceded by the element $-no-$ with feature [-3], e.g. ndínómubátsírá 'I am helping him', ndínómútakúra 'I am carrying him'.

9.3. Before sequence 10, 11, 6. An OS occurring with the sequence 10, 11, 6 is post-sensitive, e.g. ndímubátsíré 'that I may help him', ndímútakúre 'that I may carry him'. But it is a determiner (i) when the feature [+imp] is present, e.g. múbátsíré 'help him!', mútakúre 'carry him!', or (ii) when preceded by the element $-no-$ (i.e. the element $-no-$ with feature [+part]—see also section 10 (ii)), e.g. zva-ndínómubátsírá 'when - I am helping him', zva-ndínómútakúra 'when - I am carrying him'. (These inflections are in fact indirect relatives, which take participial tone patterns; the entity zva- is a relative prefix of class 8, commonly used to refer to

⁹Note that the boundary between the base and the pre-base elements (see section 4) still exists.

time.)

9.4. Summary. We may therefore say that the occurrence of an OS in an inflection is accompanied by the application of new adjustment rules, and that these new sequences in turn decide what tonological status the OS syllable will have.¹⁰

10. Pre-base Elements and Object Substitutes

But the occurrence of the OS also has repercussions on the status of the pre-base elements, as was implied several times above. The presence of an OS neutralises

(i) the second of two preceding determiners (cf. section 9.2 (ii)):

	handáitakura	'I did not use to carry'
but	handáimútákúra	'I did not use to carry him'
	ánotakura	'he is carrying'
but	ánomútákúra	'he is carrying him'

(ii) a preceding post-sensitive element (cf. section 9.3 (ii), 9.2 (i)):

	zva-ndínobátsirá	'when - I am helping'
but	zva-ndínomúbátsirá	'when - I am helping him'
	ájibátsirá	'he being used to help'
but	áimúbátsirá	'he being used to help him'

¹⁰No attempt has been made to accommodate in this formulation the dialectal variants listed in section 14; this does not seem worthwhile until we have more information on them. In the meantime, here is a summary of the OS status in these variants:

before rule sequence...	OS status	co-occurring with elements...
10, 11, 6	OS	ha- (C)
	OS	-cha- [+part] (?)
1	OS	-chi- (E), -a- [+3] (E), [+subj] neg. (E)
	OS	-a- [-3] (E), -chi- (C), -a- [+3] (C), [+subj] neg. (C), -ka- (?)
	OS	-no- (C), -i- (C)
4	OS	ha- (E)
1, 9, 6	OS	ku- (C)

ndíchá**á**bátsirá 'I being about to help'
 but ndíchá**á**mubátsirá 'I being about to help him'

(iii) a preceding radical-sensitive element:

á**á**ká**á**tákúra 'he carried'
 á**á**kam**á**tákúra 'he carried him'

11. Rule Distribution and Sequence

It is, of course, impossible to say *why* a dialect uses a certain rule or sequence of rules, since the "rules" are not there waiting to be discovered but are merely abstractions we have made from the body of data. Nevertheless, it is conceivable that they may be of some use in describing dialect differentiation (see section 13.2); even for individual dialects it may be possible to make some statements about rule distribution.

For example, in the dialect from which most of this data is taken the rule sequence 10, 11 is followed by rule 6 on some occasions and rule 7 in others. From an examination of these occurrences, we can state that the sequence 10, 11, 6 is the usual one, exemplified by such inflections as the following:

recent past participial

á**á**da 'he having loved'
 á**á**bva 'he having come from'

subjunctive + OS

ndí**á**mú**á**de 'that I may love her'
 ndí**á**mú**á**tí 'that I may tell him'

future participial + OS

á**á**chámú**á**da 'he being about to love her'
 á**á**chámú**á**tí 'he being about to tell him'

However, the sequence 10, 11, 7 occurs in (i) the subjunctive negative +OS e.g. ndí**á**sámú**á**dé 'that I may not love her', ndí**á**sámú**á**tí 'that I may not tell him' (contrast second example above); (ii) the future participial -OS, e.g.

áchadá 'he being about to love', ácháí 'he being about to say' (contrast third example above); (iii) the present participial -OS, e.g. zvadíŋodá 'when I love', zvadíŋobvá 'when I come from'. We might say that where rule 6 is concerned D radicals are temporarily shifted into the N radical class and that when rule 7 applies the opposite occurs, i.e. N radicals behave as D radicals.

12. Inflections not Described Here

No description is given in this analysis of compound or periphrastic tenses, nor of negative inflections containing the element -si-. The latter seem to be the only major area in verbal inflections where this analysis cannot be so readily applied, mainly because of the complex behaviour of the element -si- but also because in one case (the present/potential negative relative +OS) there seems to be a [-3]/[+3] distinction introduced in the inflection +OS where none existed in the inflection -OS, which has in other cases been taken to be the base form. Using the conventions outlined in section 14, we can describe the patterns as follows.

present/potential negative

relative:

F-si-nga-10,11,6-e

1. F-si-nga-OS-10,11,6-e

3. F-si-nga-OS-10,11,6-e

F-si-nga-10,11,7,12-e (F)

F-si-nga-10,11-e (C)

F-si-nga-4-e (E)

behaviour of elements

DP → DND

↙
DDD

(where D = determiner,
N = neutral, P = post-
sensitive)

participial:

F-si-nga-10,11,6-e

F-si-nga-OS-10,11,6-e

ND → DDP

F-si-nga-4-e (C)

F-si-nga-OS-10,11,6-e (C)

DN → DND

F-si-nga-10,11-e (E)

F-si-nga-OS-10-e (E)

NN → DND

future negative

relative:

F-si-sa-10,11,6-e

F-si-sa-OS-10,11,6-e

DP → NDP

F-si-sa-10,11,7,12-e (F)

participial:

F-si-sa-10,11,6-e

F-si-sa-OS-10,11,6-e

ND → DDP

Although some patterns can be discerned here, e.g. the sequence of elements neutral-determiner in the inflection -OS being replaced by the sequence determiner-determiner-post-sensitive in the inflection +OS, we can make hardly any generalisations, since we have opposing cases, (e.g. the sequence determiner-post-sensitive replaced by determiner-neutral-determiner or determiner-determiner-determiner or neutral-determiner-post-sensitive) which are too complex to permit formulation of useful rules. In the meantime, I merely list the information.

In an earlier draft of this paper it was attempted to derive the negative inflections from the affirmative inflections, e.g. the negative inflections +OS being derived from the affirmative inflections +OS and not from the negative inflections -OS. However, the formulations were still a great deal more complex than those required in the rest of the analysis.

13. Advantages of the Analysis

In the final part of the article I would like to mention what I feel are some of the advantages of the approach outlined above, farrago though it is of TG-type rules, the determiner/neutral distinction developed for Tonga in Meeussen [1963] and employed to good effect in Carter [1971,1972], and conditioned variant theory. There are, of course, areas where the present approach is difficult to apply (see section 12), but I believe that on balance it is fairly useful.

13.1. Predictive power and descriptive adequacy. Apart from the general comments we can make about person and mood (see section 5), we can give some idea of recurrences of behaviour in elements, so that the various types of dissimilation (i.e. tone polar to the preceding syllable, tone polar to the succeeding syllable, tone polar to the class of the verb radical) exhibited by some elements can be discussed, related, and worked into the general description. Since some attempt is made to state when and where this behaviour occurs, we achieve something more than a listing of the data; since the emphasis is on the relationships between the various inflectional elements, we can emphasise the interaction of these elements in the verbal system. Moreover, the approach is fairly easy to state and describe as opposed to some rule-based analyses, and the end result (see section 14) is very concise,

since a whole inflectional pattern can be described in one line. This might conceivably have some pedagogical value, but in any event, it makes inflections much easier to compare; it means, for example, that it is possible to state fairly succinctly the variant features of a particular inflectional cluster (see sections 4.4 and 5.3). Further, an explicit relationship is drawn between the tonal features of inflections without object substitute and those with object substitute. I do not, of course, mean to imply that no other approach has these features, but merely that the one I have outlined treats them, I believe, in a reasonably concise and elegant way.

13.2. Rule maps. Lastly, since the approach can be applied to various dialects, it might be possible to build up "rule maps" giving the areas in which a certain sequence is used for a particular inflection. Likewise, since the status of elements sometimes depends on what are rather minimal differences (see section 6.5), mapping of the behaviour of elements in several dialects could give more information both on this behaviour and also the relationship between the various statuses. All this would mean that the tonal aspects of verbal inflections could be fully discussed in dialect comparison in the way that the segmental features are. With a number of maps, it may be that certain patterns in sequence or status distribution would become apparent and that these in turn might help us gain a clearer picture of inter-dialectal relationships, i.e. degrees of relatedness, influence of one dialect on another, overlapping or infringement of one dialectal area by another dialect, and so on.

14. Checklist of Inflections

A checklist of the inflections the analysis was applied to now follows. This shows the patterns of a much wider range of inflections than it was possible to exemplify in the article. It is, I believe, the most concise direct representation yet formulated of so many Shona tenses and dialectal variants, and forms a good basis for further study and comparison of Shona verbal patterns.

Abbreviations are as follows: ind. (indicative), rel. (relative), part. (participial), aff. (affirmative), neg. (negative), F (full subject prefix), C (contracted subject prefix), OS (object substitute), 1. (first/second per-

son), 3. (third person), (F) (Fivaz' dialect), (E) (Stevick, eastern dialects), (C) (Stevick, central dialects), (S) (Stevick, southern dialects). Other variants not so marked are from Stevick as well, but he does not characterise them as belonging to any particular dialect. General tense glosses are given in the aff. ind. 3, using the verb 'go'. The rule sequences are placed in the position occupied by the radical in the inflection.

(1) Present: 'he goes/will go'

aff. ind.

PRONOUNS IN AKOJOSE*

Robert Hedinger
Summer Institute of Linguistics

The pronouns of Akooose, both simple and complex, are described. The subject markers with which they co-occur have also been presented. Venn diagrams have been used to show the relationships of the different grammatical persons expressed by the complex pronoun set. These complex pronouns combine references to the speaker (first person), addressee (second person) and the spoken about (third persons) in a way not always apparent from their surface forms.

1. Introduction

All languages, in spite of occasional neutralizations, grammaticalize at least the following semantic distinctions: "person" divided into first, second and third, and "number" divided into singular and plural. The resulting pronominal systems thus reflect the basic human need to distinguish both "myself" (the speaker) and "yourself" (the hearer) from other subjects being spoken about. They also show the need to be able to distinguish between a specific individual and a group of individuals.

The long recognized categories of "person" and "number" can be illustrated with English in the following table:

Table 1: English subject pronouns

	1st	2nd	3rd
sg	I	you	he, she, it
pl	we	you	they

*This paper was written during a workshop led by Ursula Wiesemann from September to November, 1980. Research for this paper was carried out under research authorization from C.R.E.A. of the Délégation Générale à la Recherche Scientifique et Technique of the United Republic of Cameroon. I am grateful to all those speakers of the language who have assisted us in one way and

Table 1 illustrates a simple system of the intersection of the two categories of "person" and "number". Note that in English in the second person the distinction between singular and plural is neutralized whereas in the third person singular, the intersection with a further category "gender" results in three forms in that box.

2. The Simple Pronouns of Akɔɔse

Looking at the pronouns in Akɔɔse, a Bantu language belonging to the so-called "Mbo cluster" (Guthrie's A.15), a similar basic system is found, but the total pronominal system is much more elaborate. In Table 2 below the basic set of pronouns is presented.

Table 2: Akɔɔse subject/object pronouns

	1st	2nd	3rd	class
sg	mè	wè	mé	1
pl	sé	nyí	bé	2

Like any other Bantu language, Akɔɔse has a noun class system characterized by distinctions in the noun prefixes as well as by concording elements on various other word classes (demonstratives, possessives, verbs, numerals, etc.). As indicated, Table 2 above gives the pronouns corresponding to classes 1 and 2 which are typically in Bantu the classes containing human nouns. The pronouns for the other classes, where there is no first, second, and third person distinction, are given in Table 3:

Table 3: The pronouns for classes 3 to 19

pronoun	class
mé	3, 4, 6
dé	5, 13
čé	7, 9, 10
bé	8, 14, 19

another and without whose help this study would not have been possible. I am also thankful to U. Wiesemann for providing the initial stimulus for writing this paper, to Stephen C. Anderson for detailed comments, and to my wife for typing the initial draft and making many helpful comments.

The classes grouped together in this table are further distinguished by differences in the noun prefixes and other word classes. For a full description of the Akɔɔse noun class system, see Hedinger [1980].

The following two examples illustrate the use of simple pronouns in object position:

- (1) àwêd mwǎnyàŋ à-hèdè mè à-nyén čǎn
our brother he-wants me to-see tomorrow

'our brother wants to see me tomorrow'

- (2) mǎ-¹húd¹ bé á ñjòŋ
I will remove ĩt(cl.14) in planting-season

'I will take it (honey) out in the planting season'

Having briefly presented the simple pronouns, the complex pronouns can now be discussed.

3. The Complex Pronouns of Akɔɔse

Already in 1900, Dorsch [1910/11:250] recognized the presence of complex pronouns in Akɔɔse which are not found in European languages, though complex pronouns are also common in Grassfields Bantu languages [Hyman 1979, Voorhoeve 1967]. In Akɔɔse, there are pronouns like the following: sú¹mé 'we two' or 'I and he'. In form, this appears to be a juxtaposition of a first person plural plus a third person singular pronoun, but semantically it combines a first person singular and a third person singular human. Another example is syá¹bê. This pronoun appears in form to be a fusion of a first person plural with a third person plural pronoun. Semantically, however, it can express any of the following: first singular plus third plural, first plural plus third singular, or first plural plus third plural.

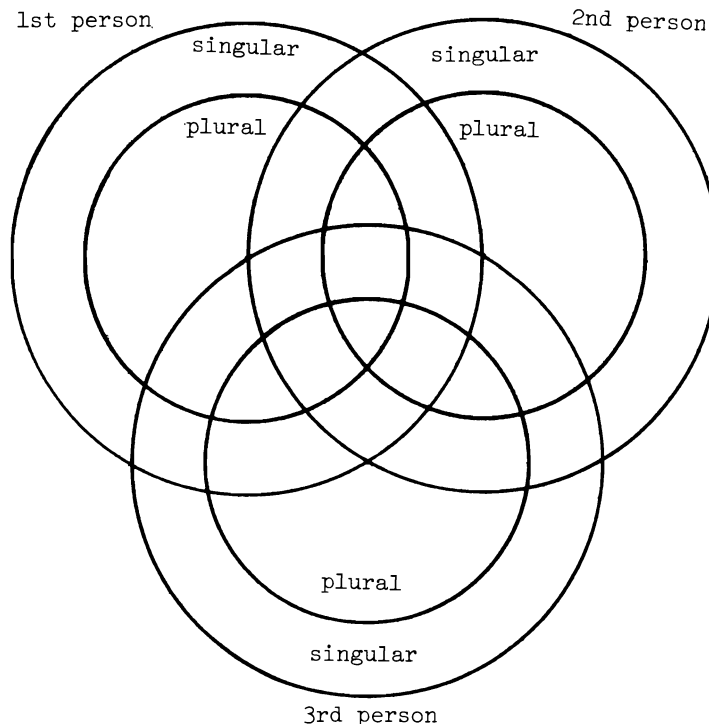

These two examples above show that besides the simple pronouns, Akɔɔse has pronouns expressing different combinations of first, second, and third persons.

To set out all the theoretically possible intersections of person and number, it has proved fruitful to use Venn diagrams,² as in Table 4 below.

¹The symbol ¹ indicates downstep.

²I am indebted to Stephen C. Anderson for suggesting the usefulness of

Table 4: A Venn diagram showing the intersection of persons and number

The three sets of two concentric circles each represent one "person". The larger circle stands for the category singular, the inner circle for plural. Each intersection of circle with circle represents a combination of two or more categories. In Table 5 on the next page all the theoretically possible combinations are indicated.

In each field, the resulting combinations have been indicated. There is, however, one limitation to the chart: at the centre of the diagram we find the intersection of first, second and third person plural. In the fields adjacent to it, six combinations of *three* persons are found. However, one possible combination—the intersection of first, second, and third person *singular*—is excluded due to the fact that double (concentric) circles have been

Venn diagrams in pronoun display.

Table 5: The theoretically possible combinations of persons and number

s = singular, p = plural, 1 = first person, 2 = second person, 3 = third person

used.³

This limitation is not serious for Akɔɔse, since there are no pronouns expressing 1st plus 2nd plus 3rd persons. However, it is inadequate for a language where such forms do exist such as the nearby Bamileke-Dschang language (Ouamba Fabian, personal communication).

The Venn diagram given in Table 5, however, needs further modification to account for examples in Akɔɔse such as bú'mé 'the two of them' or 'he and he'. This is a pronoun which includes two third singular persons. To account for such forms, a second circle for third person has to be added.⁴

In Table 6, a Venn diagram is presented showing which Akɔɔse pronouns signal the specific categories of person and number. The simple pronouns can be seen in the parts of the circles which do not intersect with any other.

At the intersection of two singular persons, we find what is usually labelled as the "dual" person. *Dual*, it appears, does not need to be set up as a basic category on the same level as singular and plural, but is simply a derivation from two singular persons combined. The dual pronouns are summarized in Table 7 below:

Table 7: The "dual" pronouns

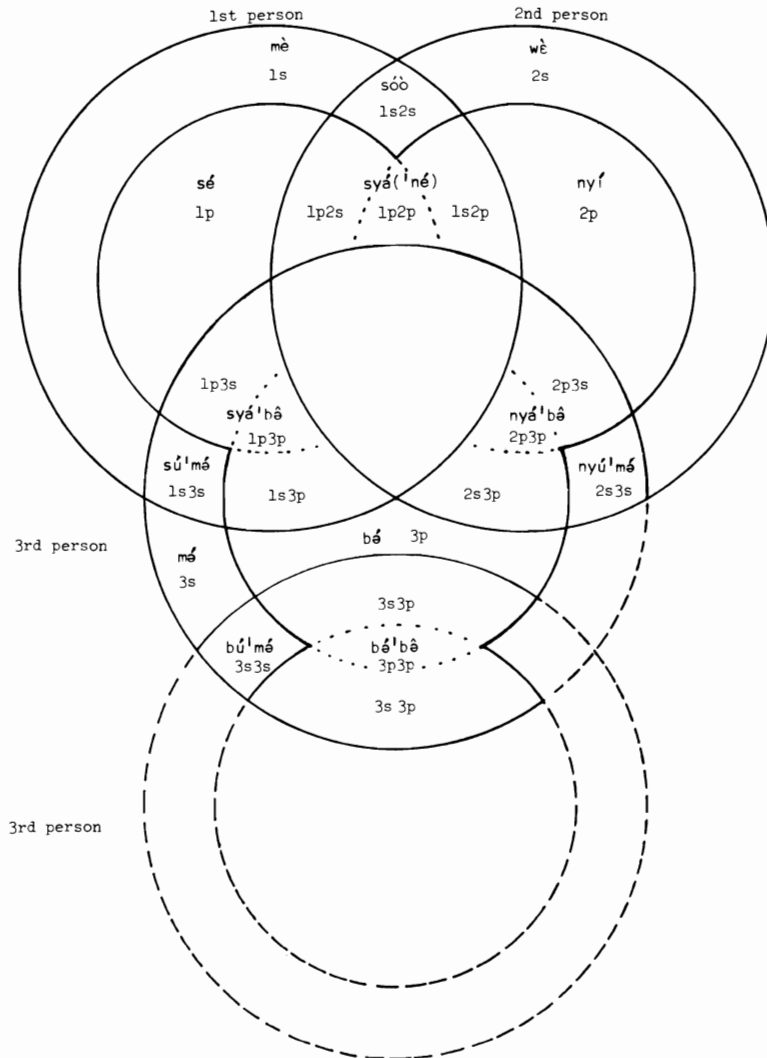

persons	pronoun	
1s + 2s	sóò	(< sé + ? + wè)
1s + 3s	sú'mé	(< sé + ? + mé)
2s + 3s	nyú'mé	(< nyí + ? + mé)
3s + 3s	bú'mé	(< bá + ? + mé)

Note that the pronouns involving a third person always have a mé as the second syllable. This corresponds to the third person singular pronoun. The two pronouns involving a first person singular begin with an s-, pointing

³By making the outer circles plural and the inner ones singular, 1p 2p 3p at the centre are simply replaced by 1s 2s 3s, all other combinations being retained.

⁴Some linguists might prefer to call this second third person a fourth person. We have chosen to call it a third person because it doesn't occur independently as a simple pronoun with a distinct form.

Table 6: Venn diagram with Akɔɔse pronouns

to a first person *plural* form as found in the pronoun sé 'first person plural' (cf. Table 2).

An example illustrating the use of a dual pronoun follows:

- (3) bé-'čámé sóò ngùn 'they will cook corn for us'
 they-will-cook-for 1s + 2s corn

Looking now at the remaining pronouns where two grammatical persons intersect, we observe that each pronoun covers three sections. Each section involves at least one plural person. These pronouns are therefore labelled "plural" and are shown in the following table:

Table 8: The "plural" pronouns

persons	pronoun	
1 + 2	syá('né)	(< sé + à + nyí)
1 + 3	syá'bê	(< sé + à + bé)
2 + 3	nyá'bê	(< nyí + à + bé)
3 + 3	bé'bê	(< bê + ? + bé)

The brackets around the 'né indicate that it is not always present. As with their dual counterparts, there is an s- where a first person is involved. In the second syllable, bê, a reflex of the third person plural rather than mé occurs when a third person is present.

Example (4) illustrates the use of a "plural" pronoun:

- (4) ...bwēm ábè é?-bàgè syá'né mònè
 things which they(cl.14)-give 1 + 2 money
 '... the things which produce money for us'

There is a clear dichotomy between pronouns which involve two singulars and those which involve at least one plural person. Any of the forms in Table 8 can express three different underlying realities: for example, syá('né) expresses 1s + 2p, 1p + 2s, and 1p + 2p. For this reason, reference to the singularity and plurality of the persons was omitted from the table.

As has been pointed out above, the first syllable of a complex pronoun is a reflex of a plural pronoun, and the second syllable is either a reflex of a singular form in the "dual" pronouns or a reflex of a plural form in the "plu-

ral" pronouns. The following generalization can be made about the number of participants referred to by the complex pronouns: the first part of a complex pronoun signals the totality of participants referred to, that is, more than one person is involved. The second part of the complex pronoun indicates the number of individual participants: when it is singular, then there are only two singular persons involved; when it is plural, then at least one of the two persons involved, or both, is plural.

Table 9: Participant number in complex pronouns

		I	II	examples
Complex pronouns	"Dual"	(pl)	(sg)	sú'mé
	"Plural"	(pl)	(pl)	syá'bê

I = Total participants, II = Individual participants

4. The Subject Markers

In sections 2 and 3 above, the simple and complex pronouns have been presented. These pronouns may function as object, as in the examples already presented, or as subject. When functioning as subject, they are obligatorily followed by a subject marker (SM), as are all subjects, pronominal or nominal. The SM is prefixed to the verb and its form is determined by the person, number, and noun class of the subject. If the subject is of any of classes 3 to 19, then the SM is of that particular class. The following table illustrates the pronouns and SM's for classes 3 to 19.

Table 10: The pronouns and subject markers for classes 3 to 19

pronoun	SM	class
mé	mé-/m'-	3,4
dé	dé-/á'-	5,13
mé	mé-	6
čé	é-	7,10
bé	bé-/é?-	8,14,19
čé	è-	9

It should be noted that there are more distinctions in the SM's than in the simple pronouns (cf. Table 3). Where there are two forms of the prefix

for the same class(es), the two forms are in complementary distribution: the one with the CV structure occurs before vowels and syllabic NC sequences, the other forms occur elsewhere. An example of subject pronoun plus its SM follows below:

- (5) sàá dé á-nyénnédéè nén bòòb è
 is-not it(cl.5) SM(cl.5)-is-seen this now Q-marker
 'isn't that proved now?'

Having presented the SM's for classes 3-19, the SM's for classes 1 and 2 (which occur with both the simple and the complex pronouns) will now be introduced.

In Table 11, a Venn diagram for the SM's is given covering the same semantic area as the one given in Table 6 for the pronouns. Each SM covers the semantic area enclosed by solid lines. That means that if a pronoun given in Table 6 functions as subject of a clause, the verb takes the prefix from Table 11 which covers the same semantic area. If, for example, mè is the subject, then the verb takes the mè- \bar{N} - prefix, as in the following example where pronoun and SM are underlined:

- (6) mwé kúl-èé mè m-pémé⁵ è
 friend tortoise-focus I I-carried Q-marker
 'is it my friend the tortoise that I have carried?'

If either nyí, nyú'mé or nyá'bê are subject, then the verb is prefixed by nyí-, as in the following example:

- (7) nyú'mé nyí-súè? wê dyàd á-díí
 2s + 3s you-return where town it(cl.5)-is
 'you two return to the town!'
- (8) è-nyénné wê nyá'bê nyé-pòngé⁶
 he-will-not-see where 2 + 3 you-will-pass-through
 'he will not see where you will pass through'

⁵The low tone of \bar{N} - '1st sg' is raised to high in this focussed construction.

⁶Nyé- is underlyingly nyí- 'second person' plus à- 'future marker'. No attempt has been made to give precise information as to tense, aspect, etc. in the examples. A paper on the verb tense-aspect system is in preparation.

Table 11: The subject markers (SM) of classes 1 and 2

If sé , sú'mé , or syá'bê are subject, then sê- is the SM used:

- (9) sú'mé sê-pèdé áwèm ndáb tè
 1s + 3s we-arrived loc-my house in
 'we (I and he) arrived at my house'

All the pronouns and the corresponding SM's for classes 1 and 2 are summarized in Table 12:

Table 12: Summary of class 1 and 2 pronouns and SM's in Akɔɔse

	person(s)	singular and dual		plural	
		pronoun	SM	pronoun	SM
simple	1	mè	mè-/Ñ-	sé	sê-
	2	wè	wè-/è-	nyí	nyí-
	3	mé	à-	bé	bé-
complex	1 + 2	sóò	dè-	syá('né)	dè-
	1 + 3	sú'mé	sê-	syá'bê	sê-
	2 + 3	nyú'mé	nyí-	nyá'bê	nyí-
	3 + 3	bú'mé	bé-	bá'bê	bé-

It should be noted that the grammatical distinction between dual and plural is neutralized in the set of SM's.

One co-occurrence of pronoun and SM which has been observed in natural texts is not included in the above table. Both sú'mé and syá'bê are shown in Table 12 to take sê- as SM. However, instances have been observed where the same pronouns are followed by the dè- SM. This is puzzling since dè- is the "inclusive" SM when it occurs without a pronoun. This is confirmed by the fact that it occurs normally with the 1 + 2 pronouns.

The hypothesis that the 1 + 3 pronoun when co-occurring with the dè- , which is 1 + 2, yields a combination of 1 + 2 + 3 has been rejected by native speakers, and so no plausible explanation has been found to account for sú'mé sê- versus sú'mé dè- . Perhaps there is a historical change in progress leading to a neutralization between sê- and dè- .

An example of this still unresolved co-occurrence of 1 + 3 pronoun with the dè- SM is example (10):

- (10) ànén òmwàád sú'mé dè-hìté wíníí bòb
 that woman 1s + 3s we-have-left there now
 'the woman and I left the place'

Earlier it was stated that the SM is obligatorily prefixed to the verb. The only exceptions observed have been when a complex pronoun is subject. In this case, the SM may be deleted, as in example (11):

- (11) sú'mé kàg 'we are going'
 1s + 3s are-going

Since many languages have separate logophoric pronouns, a note here is in order. Akɔɔse does not have a full set of logophoric pronouns but has only one form, namely a logophoric SM *mê-* which occurs in indirect speech. This one prefix is described in a forthcoming paper on direct and indirect speech.

5. Conclusion

In addition to the simple pronouns, an analysis of the complex pronouns has been presented. Since complex pronouns are also found in Grassfields Bantu languages [Hyman 1979, Voorhoeve 1967], the following questions should be investigated: What is the geographical distribution of complex pronouns? How did the languages from different sub-families acquire these pronouns, i.e. is there a genetic link or are they calques from some other language, and if so, from which? What is the morphological composition of these complex pronouns?

SOME KWA-LIKE FEATURES OF DJUKA SYNTAX

George L. Huttar
University of Texas at Arlington
Summer Institute of Linguistics

The frequent claim that creole languages on both sides of the Atlantic derive many of their syntactic features from a Kwa source is examined for three construction types in Djuka of Suriname: serial verb constructions, clefting for contrastive focus, and comparative constructions. The Djuka constructions are compared with analogous constructions in Kwa, Voltaic, Benue-Congo, Mande, and Chadic languages, Krio and West African Pidgin English, and non-African languages, both creole and non-creole. The hypothesis of a Kwa source for the clefting constructions in Djuka (and Atlantic creoles generally) is supported in particular by the data on clefting of predicates. The evidence for a Kwa source is much less clear for the serial verb constructions, while that for the comparative constructions falls in between these two. The influence of languages from other families, as well as universals, must still be taken into account, as the data from the non-African languages demonstrate.

0. Introduction

When I presented an earlier version of this paper at the 1975 International Conference on Pidgins and Creoles in Honolulu,¹ I described myself as in some ways a "Cartesian linguist," in that I was advocating a methodological skepticism. My skepticism was specifically aimed at claims in the literature for some specific West African source for particular syntactic features of West Atlantic creoles. I do welcome any attempts to narrow down the range of possible languages from which a particular feature, be it syntactic, lexical, phonological, or semantic, may have come into a particular West Atlantic creole. But I often have had the uneasy feeling that a particular West African source is claimed simply because we have more information about that West Af-

¹I would like to thank Talmy Givón for his comments on various drafts of this paper. But he can't help it if I have not always followed his insights.

rican language available than we do about other languages that might turn out to be equally good or better candidates as sources of the feature in question.

Study of creole languages on both sides of the Atlantic has uncovered a number of surface syntactic features reminiscent of specific non-creole languages of West Africa. In the literature it has been most frequently the Kwa languages that have been mentioned as resembling the creole languages with regard to these features, e.g. Bendix [1970], Williams [1971], Givón [1979b]. And it may well be that it is indeed the Kwa language group that was the source of particular syntactic features in West Atlantic creoles. But such a conclusion should be based on an examination of languages of other families in West Africa for the same features. To control for the factor of language universals, languages from other parts of the world should also be examined for these features.

This paper is a contribution to the discussion of the origin of three syntactic features of West Atlantic creoles: serial verb constructions (SVC), cleft-focus constructions, and comparative constructions. At the same time, the paper will make available data on Djuka, a creole language of Suriname which has been relatively little described in the literature, for in discussions comparing Atlantic creoles with non-creole languages of West Africa, it has been Krio of Sierra Leone which has received the most attention. Data have also been presented by Bendix [1970] on Papiamentu and San Andrés Creole English, but only in connection with serial verb constructions. And in the more general literature describing the creoles of Suriname, or of the Caribbean generally, Djuka has usually been mentioned briefly in comparison to more extensive descriptions of Sranan and Saramaccan, e.g. Alleyne [1980].

In section 1, two types of SVC found in Djuka are described; a third type common among the Kwa languages but marginal to Djuka is also discussed. Cleft-focus constructions are described in section 2 and comparative constructions in section 3. In each section the Djuka constructions are explicitly compared with the corresponding constructions in languages of West Africa. In addition, in section 1 SVC's are also discussed with regard to other languages, namely a West African creole (Krio), a Pacific pidgin (Tok Pisin), and a non-creole (Chrau of Viet Nam). Data from Sranan and Saramaccan are also included in

section 1.

1. Serial Verb Constructions

My starting point is the Djuka form of SVC, namely a sequence of verb phrases (VP) immediately juxtaposed in surface structure, and in particular with no subject or conjoining particle intervening. Following Lord [1977: 145], I am further restricting the definition of SVC to only those constructions "in which verbs after the first have no special marker (as in Yoruba)." Givón [1975] admits constructions with subjects and conjoining particles between successive VP's as SVC's. For the purposes of searching out possible African sources of Djuka SVC's, Givón's approach is historically the sounder one, as it is likely that in many languages SVC's as I am defining them have arisen from earlier constructions in which such material did intervene between successive VP's. Nevertheless, in order to limit the scope of this paper, I am omitting here any examination of constructions that conform to Givón's definition of SVC's but not to mine.

We begin with the use of three verbs of motion postposed to another VP and indicating direction.² In Djuka these verbs are *kon*, *go*, and *gwe*. In (1-3) these three verbs are used as independent verbs. Parallel examples are given for Djuka (DJ), Sranan (SN), and Saramaccan (SM).³

- | | | | | |
|-----|----|---|-----|-----------|
| (1) | DJ | a | kon | 'he came' |
| | SN | a | kon | |
| | SM | a | ko | |
| | | | he | come |

²See Alleyne [1980:91] for further examples. The use of verbs of motion *kon* and *go* before the main VP is dealt with in this paper only briefly, in section 1.4.

³Djuka data are from my own field work, in consultation with James Park. The Sranan data are also from my own field work, although I have benefited from discussion with Ch. H. Eersel. The Saramaccan data are from Naomi Glock and Catherine Rountree (see especially Glock [1972]). Tone and stress are left unmarked in all DJ, SN, and SM material except where necessary to distinguish otherwise homophonous forms.

(2) DJ a go a osu 'he went home'
 SN a go na oso
 SM a go a wosu
 he go at house

(3) DJ a gwe 'he left'
 SN a gwe
 SM -----
 he leave

The gap in (3) indicates that SM uses only two verbs in this position, as opposed to the three used in DJ and SN.

In (4-6) the same verbs are postposed to an intransitive VP.

(4) DJ a waka kon 'he walked (to point of reference)'
 SN a waka kon
 SM a waka ko
 he walk come

(5) DJ a waka go a osu 'he walked home (away from point of reference)'
 SN a waka go na oso
 SM a waka go a wosu
 he walk go at house

(6) DJ a waka gwe 'he walked away'
 SN a waka gwe
 SM -----
 he walk leave

In (7-9) they are postposed to transitive VP.

(7) DJ a tyai den fisi kon 'he brought the fish'
 SN a tyari den fisi kon
 SM a tya dee fisi ko
 he carry pl. fish come

(8) DJ a tyai den fisi go a osu 'he took the fish home'
 SN a tyari den fisi go na oso
 SM a tya dee fisi go a wosu
 he carry pl. fish go at house

- (9) DJ a tyai den fisi gwe. 'he took the fish away'
 SN a tyari den fisi gwe
 SM -----
 he carry pl. fish leave

Parallel constructions occur in Krio, as shown in (10) (gowe after intransitive VP) and (11-13) (three verbs of motion after transitive VP). Krio data are from Ian Hancock [personal communication].

- (10) i waka gowe wantem 'he walked away at once'
 he walk leave at once
 (11) i ker am gowe 'he took it away'
 he carry it leave
 (12) i ker am kam⁴ 'he brought it'
 he carry it come
 (13) i ker am go 'he took it'
 he carry it go

The same postposing of verbs of motion occurs in many Kwa languages, illustrated in (14) by Yoruba data with transitive VP [Lord 1973:276].

- (14) m̄́ mú iwè wá Tíé 'I brought a book home'
 I take book come house

Similar data have been presented in the literature for other Kwa languages, e.g. Givón [1975]. On the basis of the resemblance between Kwa languages and the Suriname creoles and Krio (as well as Papiamentu and West African Pidgin English—see Bendix [1970] and Dwyer [n.d.:348], respectively), and on the basis of what we know of the history of the Atlantic creoles, it is tempting to infer some substratal influence here. It would seem reasonable to conclude that the source of these constructions in these Atlantic creoles is a Kwa substratum.

Before jumping to such a conclusion, however, we must look at languages from other language families. The existence of the same construction, VP + verb of motion, is illustrated for Jukun, a Benue-Congo language, in (15) and for Vagala, a Gur language, in (16). Jukun data are from Welmers [1968b];

⁴In the variant *i briŋ am kam*, the notion of direction-toward is expressed by the main verb *briŋ* as well as by the postposed *kam*.

Vagala data are from Pike [1970].⁵

- (15) kú sǒ súra yà 'he carried away some yams'
 he carry yams go
- (16) ù kyìgò níf bà 'she brought water'
 she carried water came

Such data suggest caution with regard to assuming a specifically Kwa influence on Atlantic creole syntax. If we look even farther afield, to Chrau, a language of Viet Nam not known to be a creole, we find again the same postposing of verbs of motion to VP, as illustrated in (17-19). Chrau data are from David and Dorothy Thomas [personal communication].

- (17) něh văt sirăq tăt 'he brought the book'
 he carry book come/arrive
- (18) něh văt sirăq s'iq 'he took the book back'
 he carry book return
- (19) něh văt sirăq saq 'he took the book away'
 he carry book go

In the face of such data, it may still be valid to assume some West African (not necessarily Kwa but very likely Niger-Congo) origin of these SVC's in the Atlantic creoles. But more research into a variety of West African (especially non-Kwa and even non-Niger-Congo) languages is needed before a more specific source can be identified. And, as the Chrau data show us, the possibility of concomitant operation of language universals cannot yet be discounted.⁶

1.2. Dative/benefactive and 'give'. Turning now to a SVC more specifically associated with West African languages, and in the literature with Kwa languages in particular, let us examine the use of 'give' between a VP and a fol-

⁵Givón [1975] presents data from some constructions in the Gur language Mooré which he terms SVC (although with the conjoining particle between the constituent VP they do not fit the definition of SVC used here). He does not give any examples of the VP + verb of motion construction for any Gur language.

⁶Mandarin constructions similar to the SVC's discussed in this paper, some treated as SVC's and some as "co-verb sentences", are described in Li and Thompson [1973].

lowing dative or benefactive NP. The verb 'give' appears as an independent verb in the Suriname creoles in (20), preceding a dative (indirect object) NP in (21), and preceding a benefactive NP in (22).

- (20) DJ a gi mi den fisi 'he gave me the fish'
 SN a gi mi den fisi
 SM a da mi dee fisi
 he give me the-pl. fish
- (21) DJ a tyai den fisi kon gi mi 'he brought me the fish'
 SN a tyari den fisi kon gi mi
 SM a tya dee fisi ko da mi
 he carry the-pl. fish come give me
- (22) DJ a go a foto gi mi 'he went to town for me'
 SN a go na foto gi mi
 SM a go a foto da mi
 he go at town give me

An ambiguous case of VP + 'give' + NP, with both benefactive and dative readings, is given in (23).

- (23) DJ a kisi den fisi gi mi 'he caught the fish for me'
 SN a kisi den fisi gi mi or
 SM a kisi dee fisi da mi 'he caught me the fish (i.e. caught and gave them to me)'
 he catch the-pl. fish give me

Some Kwa languages exhibit the same ambiguity as in the Suriname creoles, while others use different constructions for dative and benefactive. In Yatyę, for example, this ambiguity is present, as in (24) [Stahlke 1970:63].

- (24) àmì awá ínyahwẹ́ ibí akà àwọ̀ 'I brought you a book'
 I took book came for you
 (give?) or
 'I brought a book on your behalf'

In Yoruba, on the other hand, the corresponding construction with 'give' serves only for the dative (25), while a different construction expresses the benefactive (26) [Stahlke 1970:63].

- (25) mo mú ìwé wá fún ẹ 'I brought you a book'
 I took book came gave you
- (26) mo bá àbúrò mi mú ìwé wé
 I on-behalf-of younger-brother my took book come [sic]
 'I brought a book on behalf of my younger brother'

It is instructive to note at this point that Krio resembles Yoruba in using contrastive constructions for dative and benefactive, unlike the ambiguous expression of these two deep structure notions in the surface of Yatę and the Suriname creoles. Below are the Krio forms with 'give' as independent verb (27), VP + 'give' + dative NP (28), and contrasting construction for benefactive (29).

- (27) a gi am di kọpọ 'I gave him the money'
 I give him the money
- (28) i kẹr dis kọpọ go gi am 'he took this money to him'
 he carry this money go give him
- (29) i go tọn fọ ram 'he went to town for him'
 he go town for him

The force of these data is that, at least in the modern forms, even such similar languages as Krio and the Suriname creoles differ in the use of SVC's. This difference may indicate a different origin within West Africa for the Krio construction and the Suriname constructions, which would not be surprising given the very different history of the Krio society and the Suriname societies. But the difference could equally well be due to subsequent development from a common source. Krio has, after all, been exposed to post-creolization influences from English in a way that the Suriname creoles have not. If it does turn out that we could discover that Krio never has used the gi construction to express benefactive, then the benefactive use of this construction would probably be neither a language universal nor a pidgin-creole universal. That it is not found, even in the dative use, in all pidgins and creoles is suggested by the Tok Pisin data below with 'give' as independent verb (30), 'give' in single clause but not SVC (31), and dative and benefactive without 'give' (32-33).⁷ Tok Pisin data are from Ellis Deibler [personal

⁷The discussion of clauses with 'give' in Mauritian Creole in Corne [1970:

communication].

- (30) em i givim ol dispela pis long mi
 he give pl. this fish at me
 'he gave me the fish'
- (31) em i hukim ol dispela pis na givim (long) mi
 he catch pl. this fish and give (at) me
 'he caught the fish and gave them to me'
- (32) em i kisim ol dispela pis i kam long mi
 he take pl. this fish come at me
 'he caught the fish and brought them to me'
- (33) em i go long taun na baim rais bilong mi
 he go at town and buy rice of me
 'he went to town and bought rice for me'

In (34) and (35) we see a similar construction, i.e. verb serialization with 'give', in Chrau, but not a precisely parallel one (VP + 'give' + NP + 'have' rather than simply VP + 'give' + NP).

- (34) nēh văt ca sĭq an ănh iun 'he brought me a fish'
 he carry fish return give me have
- (35) nēh văt an ca ănh iun 'he carried a fish for me'
 he carry give fish me have
 or
 'he brought me a fish'

Finally, with reference to the West African data, it should again be pointed out that Gur languages such as Vagala also have SVC's with 'give' parallel to the Kwa usage. Two examples of its use for benefactive are given in (36-37). I do not have data to indicate whether this SVC is also used for the dative. (Note that in another Gur language, Mooré, the construction with kó 'give' following a VP to introduce indirect object must have the connective n between the preceding VP and kó and thus is not a SVC in the sense used here [Lehr et al. 1966:56].)

- (36) ù wà sá !ígyò tè ù bówl
 he came danced igyo-dance give his village
 'he danced the igyo-dance for his village'

19] also makes no allusion to a SVC with don 'give' between a VP and a following dative NP.

(37) ù é ù té ñ
he did it gave me

'he did it for me'

The dative use of 'give' in the Benue-Congo language Jukun is illustrated in (38).

(38) bé ze yá yá kuru yô ka 'they carried it to the chief
they take go give chief inside town wall of the town'

The occurrence of SVC's with 'give' in Kwa, other African, and non-African languages supports the supposition that such a syntactic feature could arise in different areas independently, perhaps as a result of some natural semantax (see Bickerton [1974]). Whether or not this is true, the African data prevent us from assigning a specifically Kwa source to the Djuka construction. Not only is it unlikely that we will, with further historical research, be able to find a specific source for such a construction, it is also doubtful whether there ever was such a specific single-language source, rather than a more general areal source.

1.3. Instrumental and 'take'. The third sort of SVC to be discussed here is dealt with not in order to describe Djuka syntax directly, but to highlight a significant difference between Djuka on the one hand and the Kwa languages and Krio (as well as Papiamentu, although it is not illustrated here) on the other.

For Kwa data, we use examples from Yoruba [Lord 1973:291]. In (39), a VP consisting of 'take' + NP precedes another VP and denotes an instrument.

(39) ó fṛ òbē gé ērā 'he cut the meat with a knife'
he take knife cut meat

The same construction is used to express manner in Yoruba, as in (40).

(40) ó fṛ èsò gé ērā 'he cut the meat with care'
he take care cut meat

The Gur language Vagala uses the same pattern for instrument, as in (41). I do not know whether manner is also expressed using this construction in Vagala.⁸

⁸See Bendix [1970] for examples of this type of SVC for instrumental in Papiamentu and Ijo.

- (41) ù kpá kíyžèé mòng ówl 'he cut the meat with a knife'
 he took knife cut meat

For the instrumental usage, Krio uses the same construction, given in (42), although another construction given in (43), considered Anglicized Krio, is also used.

- (42) i tek nɛf čɛčɛ di bif 'he cut the meat with a knife'
 he take knife cut the meat
- (43) i čɛčɛ di bif wit nɛf " " " " " " "
 he cut the meat with knife

Krio does not use a SVC with 'take' for manner, however.

In Djuka, such a SVC is rare for expressing instrument and does not occur at all for manner. Thus (44) is possible but very infrequent. A Djuka speaker is more likely to use either the simple clause construction given in (45) or two overtly conjoined clauses as in (46). I believe the same can be said of Sranan and Saramaccan, although I do not have enough experience with those languages to support this hypothesis.

- (44) a teke nɛfi koti a meti 'he cut the meat with a knife'
 he take knife cut the meat
- (45) a koti a meti anga nɛfi " " " " " " "
 he cut the meat with knife
- (46) a teke nɛfi, ne a koti a meti " " " " " " "
 he take knife then he cut the meat

The resemblance between the usual Djuka construction in (45) and English is evident (cf. the Krio example (43)). Does this mean that this particular construction was borrowed into Djuka from English? Not necessarily, for Kwa languages also have a parallel construction using 'with' for expressing instrument. We again limit our data to a Yoruba example, given in (47) [Lord 1973:281].

- (47) ó gé ɛrā̄ kpèlú òbē 'he cut the meat with a knife'
 he cut meat with knife

Further, it should be remembered that many languages, including the Suriname creoles, English, and Kwa languages (but not Krio) use the same prepositional construction for instrumental, manner, and comitative, as in (48-59).

English

- (48) he cut the meat WITH a knife
 (49) he cut the meat WITH pleasure
 (50) he cut the meat WITH Kofi

Suriname creoles

- (51) DJ a koti a meti ANGA nefi 'he cut the meat with a knife'
 SN a koti a meti NANGA nefi
 SM a koti di gbamba KU faka
 he cut the meat with knife
- (52) DJ a koti a meti ANGA piisii 'he cut the meat with pleasure'
 SN a koti a meti NANGA prisiri
 SM a koti di gbamba KU piizii
 he cut the meat with pleasure
- (53) DJ a koti a meti ANGA kofi 'he cut the meat with Kofi'
 SN a koti a meti NANGA kofi
 SM a koti di gbamba KU kofi
 he cut the meat with Kofi

(For (53), a much more common construction, in Djuka at least, would be *kofi anga en koti a meti* 'Kofi and he cut the meat'; cf. 59.)

Kwa⁹ (Yoruba [Lord 1973:281-282])

- (54) ó gé ērā̄ KPÈLÚ òbē 'he cut the meat with a knife'
 he cut meat with knife
- (55) ó gé ērā̄ KPÈLÚ èsò 'he cut the meat with care'
 he cut meat with care
- (56) ó gé ērā̄ KPÈLÚ ākī 'he cut the meat with Akin'
 he cut meat with Akin

Krio

- (57) i ʒeʒe di bif WIT nef 'he cut the meat with a knife'
 he cut the meat with knife

⁹Note, however, that this alternative method of expressing instrument is apparently not found in all Kwa languages; see Stewart [1963] and discussion by Pike [1970:2-3] on Twi.

- (58) i čěčě di bif WIT gladi 'he cut the meat with pleasure'
 he cut the meat with pleasure
- but* (59) i en kofi čěčě di bif 'he cut the meat with Kofi'
 he and Kofi cut the meat

We note in passing, without citing examples, that Tok Pisin does not use a SVC with 'take' for expressing instrument; it uses the general preposition *long* to introduce an instrument, but a different preposition, *wantaim*, to introduce comitative. On the other hand, Vietnamese does express instrument with a SVC, e.g. 'he use knife cut meat' = 'he cut meat with a knife', but does not express manner in this way.¹⁰

1.4. Other serial verb constructions. We mention briefly here some other SVC's attested in Djuka, without discussion. For description of parallel SVC's in Saramaccan, see Glock [1972:56-61].

(1) The verbs of motion postposed to VP as discussed in section 1.1 can also be preposed, as in (60-61). (Cf. Eze [1980:69-73] for a more detailed description of a similar construction in Nigerian Pidgin English.)

- (60) a go luku 'he went and looked'
 he go look
- (61) a gwe go luku 'he left to go look'
 he leave go look

(2) Certain verbs that occur in transitive clauses are preposed to VP, taking then the same position as other forms that are clearly modals. In (62) *wani* 'want' appears in a transitive clause. In (63) it appears preposed to a VP in the same position as the modal *musu* in (64). The verb *sabi* 'know' has a similar distribution.

- (62) a wani den fisi 'he wants the fish'
 he want the-pl. fish
- (63) a wani go 'he wants to go'
 he want go
- (64) a musu go 'he has to go'
 he oblig. go

¹⁰Much of sections 1.1-1.3 appeared in a somewhat different version in Huttar [1974].

(3) Successive clauses having the same subject (and optionally other common constituents as well) are juxtaposed with common elements deleted. Example (65) may be viewed as the surface representation of a sutu a bofoo 'he shot the tapir' and a kii a bofoo 'he killed the tapir', with identical subject a and object a bofoo deleted from the second clause.¹¹

(65) a sutu a bofoo kii 'he shot the tapir dead'
 he shoot the tapir kill

This type of SVC differs from the others described or mentioned in that the class of verbs occurring in each VP of such a SVC is open.

(4) The comparative constructions discussed in section 3 are another type of SVC.

2. Cleft-focus Construction¹²

A neutral (non-emphatic) declarative Djuka sentence with one constituent clause is illustrated in (66).

(66) mi dda kii tu pakila anga goni a busi tide
my father kill two peccary with gun at jungle today
 Subject Pred Object Adjunct Adjunct Adjunct
 'my father killed two peccaries with a gun in the jungle today'

To give contrastive focus to any one of the surface constituents of the sentence (that is, to explicitly contrast that constituent with other items in paradigmatic relationship with it), the constituent is copied in initial position in the sentence and preceded by na 'be'. In all cases except focus of Predicate, the copied constituent is deleted from its position in the neutral sentence, so that we may describe the result as a clefting of the constituent out of its original position. Such clefting, or copying and deleting, is vac-

¹¹See the similar analysis of such SVC's in Twi by Stewart [1963:145]. On Nigerian Pidgin English, see Eze [1980:74ff.]; on Guyana, Jamaica, and Surinam creoles, see Alleyne [1980:93]. Constructions parallel to (65) are described by Thompson [1973] for Mandarin as "resultative verb compounds", in which the 2nd VP indicates a result of the first.

¹²I am especially indebted to James Park for his detailed help on sections 2 and 3 of this paper and to Franklin Velanti of Drietabbetje for his suggestions and reactions as a native speaker of Djuka.

uous in the case of the Subject, which occurs initially in the neutral sentence. Contrastive focus for Subject is marked only by the preceding *na*. Focus of the six constituents of (66) results in sentences (67-72). Note that in (68) the predicate appears twice, both in copied (front) position and in neutral position. The focused nominal constituents in (67) and (69-72) occur only in copied position.¹³

(67) Subject Focus

na mi dda kii tu pakila anga goni a busi tide
 it-is my father kill 2 peccary with gun at jungle today
 'it's my father that killed two peccaries with a gun in the jungle today'

(68) Predicate Focus

na kii mi dda kii tu pakila anga goni a busi tide
 'it's killed my father killed two peccaries with a gun in the jungle today' (i.e. in contrast to merely hitting or wounding them, he specifically killed them)

(69) Object Focus

na tu pakila mi dda kii anga goni a busi tide
 'it's two peccaries that my father killed with a gun in the jungle today'

(70) Instrumental Adjunct Focus

na anga goni mi dda kii tu pakila a busi tide
 'it's with a gun that my father killed two peccaries in the jungle today'

(71) Locative Adjunct Focus

na a busi mi dda kii tu pakila anga goni tide
 'it's in the jungle that my father killed two peccaries with a gun today'

(72) Temporal Adjunct Focus

na tide mi dda kii tu pakila anga goni a busi
 'it's today that my father killed two peccaries with a gun in the jungle'

¹³While (66-72) are grammatical, they are rather unusual because of

When receiving contrastive focus, the third singular subject pronoun is *en*, the form also used for all oblique cases; *a* occurs only as a non-focused subject. Compare (73) and (74).

- (73) *a go* 'he went'
he go
- (74) *na en go* 'it's he who went'
it-is him go

Besides receiving positive contrastive focus as just illustrated in (67-72), a constituent can also receive negative contrastive focus, whereby it alone (as opposed to the whole sentence) is negativized. Negative focus is accomplished by the same process as positive focus except that the preposed particle is *ná* 'not; not be' rather than *na* 'be'. Examples (75) and (76) illustrate negative focus of Predicate and Object respectively.¹⁴

- (75) *ná kii mi dda kii tu pakila anga goni a busi tide*
 (it-is)not kill my father kill 2 peccary with gun at jungle today
 'it's not killed my father killed two peccaries with a gun in the jungle today' (i.e. whatever he may have done to them, he specifically did not kill them)
- (76) *ná tu pakila mi dda kii anga goni a busi tide*
 'it's not two peccaries that my father killed with a gun in the jungle today'

Compare (77) in which the whole sentence is negativized, i.e. the entire proposition is denied.

- (77) *mi dda ná kii tu pakila anga goni a busi tide*
 'my father did not kill two peccaries with a gun in the jungle today'

their length and number of constituents. This is particularly true of (67-72), where clefting to emphasize one constituent would ordinarily preclude explicit mention of so many other elements.

¹⁴Chris Corne [personal communication] reports that in Mauritian Creole, a sentence with fronted negative marker similar to (75) and (76) does not have the negative meaning of the Djuka construction, but rather an emphatic positive meaning. By contrast, see Eze [1980:87-88] on front-shifted verb preceded by negative 'be' in Nigerian Pidgin English with the same meaning as in Djuka.

The negative element *ná* in (77) cannot receive focus through clefting nor can the unstressed particles *be* 'completive', *sa* 'irrealis', *o* 'future', or *e* 'continuative':

	Neutral		Focus
(78)	a be go he comple- go tive	'he had gone'	na go a be go 'it's gone he had gone *na be a be go
(79)	a sa go he irreal- go is	'he will go'	na go a sa go 'it's go he will go' *na sa a sa go
(80)	a o go he future go	'he will go'	na go a o go 'it's go he will go' *na o a o go
(81)	a e go he contin- go uative	'he's going'	na go a e go 'it's going he is go- ing' *na e a e go

On the other hand, stressed modals *musu* 'must' (but not its unstressed alternate *mu*), *wani* 'want', and *poi* 'be able' can be clefted for emphasis, either positive or negative. This usage is illustrated in the exchange in (82):

- (82) Na wani ju wani go? 'Is it that you want to go?'
it-is want you want go
- Nono. Ná wani mi wani. Na musu mi musu.
no (it-is)not want I want it-is must I must
- 'No, it's not that I want to go, but that I have to go.'

In sentences with more than one verb, be it in one clause or more than one, i.e. sentences with SVC's, not all elements can be clefted with equal ease. Sentence (83) has one constituent clause with a main verb and a postposed directional verb *kon*. While the main verb can undergo clefting as in (84), the directional *kon* can neither be clefted as shown in (85) nor clefted in the manner of nominal constituents as in (86).

- (83) a iti a patu kon 'he threw the pot to me'
he throw the pot come
- (84) na iti a iti a patu kon 'it's threw he threw the pot to
it-is throw he throw the pot come me'
- (85) *na kon a iti a patu kón

(86) *na kon a iti a patu

Sentence (87) has two constituent clauses, the first with verbal elements *tyai* and *kon*, the second with *poti*. Clefting of *tyai* (88) is normal, while that of *kon* (89) and of *poti* (90) is unacceptable:

(87) a tyai a patu kon poti a osu
he carry the pot come put at house

'he brought the pot and put it in his house'

(88) na tyai a tyai a patu kon poti a osu
it-is carry he carry the pot come put at house

'it's brought he brought the pot and put it in his house'

(89) *na kon a tyai a patu kon poti a osu

(90) *na poti a tyai a patu kon poti a osu

The adjunct in the second clause can also undergo clefting, as in (91).

(91) na a osu a tyai a patu kon poti

'it's at his house that he brought the pot and put it'

Similarly, the object may be clefted, as in (92) or as in (94) (cf. 93).

(92) na a patu a tyai kon poti a osu

'it's the pot that he brought home'

(93) a go teke a patu tyai kon poti a osu
he go take the pot carry come put at house

'he went and got the pot and brought it home'

(94) na a patu a go teke tyai kon poti a osu
it-is the pot he go take carry come put at house

'it's the pot that he went and got and brought home'

Further, the verb *teke* in (93), which I assume to be more lexically salient than the directional verb *go* preceding it, can be copied in initial position under clefting, as in (95). The directional verb *go*, although more "grammatical" and less "lexical" than *teke*, is still the first verb in the sentence and can similarly undergo clefting, as in (96).

(95) na teke a go teke a patu tyai kon poti a osu

'it's got he went and got the pot and brought it home'

- (96) na go a go teke a patu tyai kon poti a osu
 'it's went he went and got the pot and brought it home'

I leave aside here the interesting question of whether the fact that both *go* and *teke* can undergo clefting is due to diachronic development in Djuka of *go* and other verbs of motion in this position from fully lexical items to partly grammatical ones. Both Givón's [1975] argument for such a development in Niger-Congo and Pike's [1967] more general comments on fully lexical verbs developing into grammatical morphemes have their force. But I do not here assume such a development in Djuka, not having examined the available evidence on earlier stages of Djuka.

In summary, it appears that the following elements in a sentence can undergo clefting for contrastive focus:

- i. subject
- ii. object
- iii. adjuncts of first or second clauses of sentences¹⁵
- iv. stressed modals
- v. first verb of sentence
- vi. first lexical verb of sentence if preceded by directional verb

The following elements cannot be front-shifted:

- i. unstressed particles *be*, *sa*, *o*, *e*
- ii. adjuncts of clauses other than in *iii* above
- iii. the negative particle *ná*
- iv. verbs other than in *v* and *vi* above

Among languages of West Africa, clear examples of constructions parallel to the Djuka cleft-focus construction are found in West African Pidgin English (WAPE). Compare the neutral sentence (97) with (98), where the subject *Jòn*, already in front position, is preceded by *na* 'be' and thereby marked for emphasis [Dwyer, n.d.].

¹⁵The constraints on clefting of objects and adjuncts from non-initial clauses are not clear.

- (97) Jòn dè còp fùfu 'John is eating foo-foo'
 John cont. eat foo-foo
- (98) na Jòn dè còp fùfu 'it's John who is eating foo-foo'
 it-is John cont. eat foo-foo

Cleft-focus of the object is illustrated in (99) (cf. 97). Unlike the Djuka construction, however, the WAPE construction does not delete the object NP from neutral position after copying it in front, but replaces it by a pronoun (am in (99)).

- (99) nà fùfu Jón dè còp àm 'it's foo-foo that John is eating'
 it

Cleft-focus of a locative element is illustrated by (100-101), and of a temporal element by (102-103). Here the emphasized elements are deleted, not replaced by pro forms, in their neutral positions, exactly parallel to the Djuka construction.

- (100) à dón lúk àm fò dé 'I found it there'
 I completive find it (prep.) there
- (101) nà fò dé à dón lúk àm
 it-is (prep.) there I completive find it
 'it's there that I found it'
- (102) à kám tudé 'I came today'
 I come today
- (103) nà tudé à kám 'it's today that I came'
 it-is today I come

The expression of contrastive focus by clefting with some form of 'be' is also found in non-creole languages of West Africa. In the Kwa language Igbo, for example, the subject (already in front position) is preceded by 'it is' when emphasized [Carrell 1970].¹⁶

- (104) nwókó hère ákwékwó 'the man saw the book'
 man see book
- (105) ó bè nwókó hère ákwékwó 'it's the man who saw the book'
 it is man see book

¹⁶See Givón [1979:246-248] for a reconstruction of the historical development of these "cleft-focus" constructions.

This construction exactly parallels the Djuka cleft-focus construction with focused subject. For the post-verbal object, however, Igbo differs from Djuka by inserting the relative marker *kà* after the object, as in (106) (cf. 104).

- (106) *ó bè ákwékwó kà nwókó hère* 'it's the book that the man saw'
 it is book that man see

In another Kwa language, Yoruba, the added form of 'be' follows, rather than precedes, the focused element, as (107-108) show for subject, (109-110) for object, and (111-112) for locative [Bangboşe 1966:56-57].

- (107) *ìyẹn ò da* 'that's not good'
 that-one not good
- (108) *ìyẹn ni ò da* 'it's that one that's not good'
 that-one is not good
- (109) *wón raşo* 'they bought a dress'
 they bought-dress
- (110) *aşo ni wón rà* 'it's a dress that they bought'
 dress is they bought
- (111) *ó bẹrẹ lé.kó* 'it started in Lagos'
 it started in-Lagos
- (112) *(ní) èkó ló ti bẹrẹ* 'it's in Lagos that it started'
 (in) Lagos is it started

The situation appears to be similar for two other Kwa languages, Ewe as described by Warburton et al. [1968] and Twi as described by Redden et al. [1963], both for focused subject. In Twi an additional difference from Djuka is evident, in that the subject occurs both before and after the particle *na* in the latter position as a verb prefix. Christaller [1875:§247] gives numerous examples for both subject and post-verbal elements undergoing clefting in Twi.

In Efik¹⁷ the particle (*ké*) follows the focused element as in Yoruba. In Efik, however, the particle is no longer a form of 'be', though it may

¹⁷Efik is classified by Greenberg [1966] as a non-Bantoid member of Benue-Congo, a subdivision, like Kwa, of Niger-Congo. Givón [1975] tentatively follows Greenberg. Welmers [1971:763], however, is "convinced that Efik and certain other languages in Eastern Nigeria are more clearly related

well have been earlier.¹⁸ Clefting of object is illustrated by (113-114) and of locative by (115-116) [Welmers 1968a:41-42]. The particle *ké* is homophonous with a locative preposition [Welmers 1968a:40], a homophony which Lord [1973] has argued has arisen in Kwa languages through the development of locative prepositions from locative verbs. In Djuka, the form *na* occurring at the beginning of cleft-focus constructions has been treated here as the copula *na* 'be', because of the occurrence of *ná* 'not, not be' in the corresponding position for negative focus. Unlike the situation in Kwa (and Efik), the Djuka locative preposition *na* is homophonous with this copula, but not with the locative/existential verb *de*.

- (113) *ńkedèp ìboró* 'I bought bananas'
I-bought bananas
- (114) *ìboró ké ńkedép* 'it's bananas that I bought'
bananas (part) I-bought
- (115) *ńkaka íkòt Ékpené* 'I went to Ikòt Ekpené'
I-went
- (116) *íkòt Èkpené ké ńkaka* 'it's Ikòt Ekpené that I went to'
(part) I-went

For focused subject, no particle occurs at all. The emphatic status of the subject is marked only by the tone of the verb (cf. the different tones on the verb in (113-114) and (115-116)) and, in the case of pronominal subjects, by different pronouns.¹⁹

Turning to the Gur family, we find in Mooré a special particle (*ya* for positive, *ka* for negative) occurring before the focused element. In addition, the particle *la* occurs after it in the same position as Igbo rela-

to Igbo than to the Bantu languages, and these are therefore classed as Kwa rather than Benue-Congo. Indeed the whole question of a boundary between Kwa and Benue-Congo, and of the integrity of each of these branches of the Niger-Congo family, is open for further investigation." This same position is assumed in Welmers [1973].

¹⁸I owe this diachronic observation to Talmy Givón [personal communication]. Cf. Givón [1974].

¹⁹Cf. (73) and (74) for Djuka emphatic pronoun *en*.

tive marker *kà* . Both preposed *ya* and postposed *la* are identical or homophonous with forms of two verbs 'be'. The cleft-focus construction is illustrated for object in (117-118) and for locative in (119-120) [Lehr et al. 1966:107-108].²⁰

- (117) *m díkdà móbilì* 'I'm taking the car'
I am-taking car
- (118) *yá móbil la m díkdà* 'it's the car that I'm taking'
it-is car it-is I am-taking
- (119) *ub wáa Dákad* 'they arrived in Dakar'
they arrived Dakar
- (120) *ya Dákad la ub wáé* 'it's in Dakar that they arrived'
it-is Dakar it-is they arrived

The Mooré data (and, depending on whose classification scheme you follow, Efik data as well) indicate that contrastive focus is signalled by clefting in other African languages than Kwa languages. However, the particular pattern of copying the verb but not deleting it from its original position, leaving a full verb in both positions, seems to be peculiar to Kwa.²¹

Before too quickly assuming a Kwa, or even an African, substratum as the source of the Djuka construction, we should consider the possibility of influence from the European languages. We note first of all that English also expresses contrastive focus, among other ways, by moving the elements in focus to initial position and preposing the appropriate tense of 'it is' as in (121) for object, (122) for locative, and (123) for subject.

- (121) It was two peccaries (that) my father killed in the jungle.

²⁰The construction appears to be used for focus of post-verbal elements only, not of (pre-verbal) subject (cf. Efik).

²¹Givón [personal communication]. Jaggar [1978:80] does report for Hausa a device for marking a VP with contrastive focus, but he goes on to say that the verb "may not be repeated in full when marked (+F) but simply leaves the substitutive *yi* ." Until we have examined more closely earlier stages of Djuka or other Suriname or West Atlantic creoles, we cannot press too far the differences among various Kwa languages. It may be, for example, that the Djuka cleft-focus construction earlier had a relative marker as Igbo still does.

- (126) a wooko ja, a moo mi 'this job is too much for me'
the work here it me
- (127) ne a sani kon moo en 'then the thing began to be too
then the thing came him much for him'
- (128) Baa Kujaku moo Baa Bubu 'Brer Deer beat (won over) Brer
brother deer brother jaguar Jaguar'

From these examples we may gloss this sense of *moo* as 'surpass, be too much for'.

The morpheme *moo* also occurs following a VP with no following NP. In this usage it occurs in negative (129), interrogative (130), and imperative (131) sentences, but not in positive declarative sentences except in the context of another sentence with *moo*, as in (132).

- (129) mi á sabi en moo. 'I don't know him any more.'
I not know him
- (130) ju sa sabi en moo? 'Do you possibly still know him?'
you irrealis know him
- (131) iti go moo 'Pour some more.'
throw go
- (132) "Mi sa subi go moo?" "Shall I climb further?"
I irrealis climb to
"Ai, subi go moo." "Yes, climb further."
yes climb go
Ne a subi go moo. Then he climbed further.'
then he climb go

In (133-136), *moo* precedes a stative verb/adjective in attributive (133-134) and predicative (135-136) position, expressing comparative (including superlative) degree.

- (133) a moo langa wan na mi dda 'the taller one is my father'
the tall one be my father
- (134) ondi na a moo koni man? 'who is the cleverest one?'
which be the clever person
- (135) dati moo langa 'that one is taller'
that tall
- (136) a sisa moo koni 'the sister is the cleverest'
the sister clever

In (137-139), *moo* follows intransitive (137), transitive (138), and

stative (139) VP and precedes a NP serving as a standard of comparison. Examples (137b-139b) illustrate an alternative construction with *moo* also preceding the VP.

- (137) a. a e waka moo mi 'he travels more than I do'
 he cont. travel I
- b. a e moo waka moo mi
 he cont. travel I
- (138) a. a e sutu meti moo mi 'he shoots more game than I do'
 he cont. shoot game I
- b. a e moo sutu meti moo mi
 he cont. shoot game I
- (139) a. a langa moo mi 'he's taller than I am'
 he tall I
- b. a moo langa moo mi
 he tall I

Finally, *moo* is used in expressions of proportional comparison as in (140), which is similar to English 'the longer the better'. In (141), *moo* occurs not only nominalized (preceded by *on* 'which, whatever'), but also within the VP of each clause, a situation not paralleled in English.

- (140) a moo a langa, a moo a bun 'the longer it is, the better'
 the it long the it good
- (141) on moo mi e moo bali a pikin, on moo a e moo du en
 which I cont. call the child which he cont. do it
 'the more I call the child, the more he does it'

The morpheme *pasa* is also used transitively as in (142-143) and intransitively as in (144-145).

- (142) a kon pasa mi 'he overtook me'
 he come me
- (143) a pasa a taa boto 'he overtook the other boat'
 he the other boat
- (144) san pasa? 'what happened?'
 what
- (145) wan sani pasa anga mi 'something happened to me'
 a thing with me

In the transitive usage, the sense of *pasa* may be glossed as 'pass, over-

take' and in the intransitive as 'happen'.

While *moo* precedes VP to express comparison, *pasa* follows them to express intensification, as for a stative in (146) and an intransitive in (147).

- (146) a langa pasa 'it's very long'
it long
- (147) a fufuu pasa 'he steals a lot'
he steal

Other morphemes occur in the same position, expressing various degrees of intensification. Some of these are given in (148-149), illustrated for stative VP only.

- (148) a langa fu toko 'it's really long'
it long of war
- (149) a langa tumisi 'it's very long/it's too long'
it long very

The expression (transitive VP?) *pasa maiki* also occurs in this position:

- (150) a langa pasa maiki 'it's very long (long beyond
it long mark measure)'

The use of *pasa* + NP after VP is illustrated with intransitive verbs (151-152) and a stative verb, where it is marginally acceptable (153).

- (151) a o goo pasa ju 'he'll grow bigger than you'
he fut. grow you
- (152) a waka pasa mi 'he overtook me'
he walk I NOT *he walked more than I did
- (153) ?a langa pasa mi 'he's taller than I am'
he tall I

Transitive VP + *pasa* + NP (154) is ungrammatical.

- (154) *a sutu meti pasa ala sama ('he shoots more game than anyone')
he shoot game all person.

The use of a verb meaning '(sur)pass' as a comparative marker is a fairly well known feature of the West African language area. An example from Efik is given in (155) [Welmers 1968a:72]; its structure corresponds exactly to that of the Djuka equivalent given in (139), repeated here, if

moo in (139) is taken as a verb on the basis of sentences like (124-128). (As Russell Schuh has pointed out to me, however, moo in (139) could be construed adverbially on the basis of examples like (129-136), suggesting a parallel between moo in (139) and -er in English 'he (is) tall-er (than) me'.)

(155) ɛ̃yé ónyóŋ ákàn mí 'he's taller than I am'
he (is)-tall surpass me

(139) a langa moo mi

For the Kwa language Gwari, Hyman and Magaji [1970:72-73] gloss the verb du as 'to pass by' when used as an independent verb, as in (156), but as 'surpass' in comparative constructions, as in the three alternative forms in (157-159).

(156) wó lá dù ya 'he has passed by'
he comp. pass-by release

(157) wo du mí ó kpâ 'he's taller than I am'
he surpass me at height

(158) wokpá dū mikpá " " " " "
his-height surpass my-height

(159) wokpá dū minyá " " " " "
his-height surpass mine

None of (157-159) parallels the Djuka-Efik pattern of NP + VP + 'surpass' + NP. Igbo appears to follow the Gwari pattern as well (see Carrell [1970:64-65] and Swift et al. [1962:358ff.]).

Other Kwa languages, however, do have a comparative construction parallel to that of Djuka and Efik. For Twi, the verb 'surpass' occurs with (160) and without (161) a following NP [Redden et al. 1963:50].

(160) ɔwáre sɛñ ní ñúá 'he is taller than his brother'
he-is-tall surpass his sibling

(161) ɔwáre sɛñ 'he is taller'

(In the corresponding Djuka sentences, moo and pasa are both used in the first case, although moo is much more usual; cf. (139) and (153). In the second case, only pasa occurs; cf. (146), but also (129-132).

The verb wú 'surpass' in the Kwa language Ewe is used as a comparative marker both with (162) and without (163) a following NP, just as in Twi

[Warburton et al. 1968:182-183].

- (162) xosia loló wú éma 'this room is bigger than that
room-this (is)-big surpass that-one one'
- (163) esia loló- wú 'this is bigger'
this-one (is)-big surpass

For Yoruba, the comparative marker *ju* (with various tones) is glossed as 'too' [de Gaye and Beecroft 1922] or 'to be excessive' [Stevick and Aremu 1963]. The use of *ju* without a NP is illustrated in (164) and (165) and with a NP in (166). Besides *ju* preceding the NP, the comparative construction also includes a post-NP *lò*, as in (166), so that the Yoruba pattern differs in this respect from the pattern found in Djuka, Efik, Twi, and Ewe [Stevick and Aremu 1963:285-286].

- (164) ó gbóná jù 'it is too hot'
it (is-)hot excessive
- (165) tíì yí lē jù 'this tea is very strong'
tea this strong excessive
- (166) ȡsàn yí dún jū èyūn' lȡ 'this orange is sweeter than that'
orange this sweet be excessive that go

In the Mande language Kpelle, the VP *tɛɛ...mà* 'pass by on top' is used in comparative constructions, as in (167) [Gay and Welmers 1971:89].

- (167) bérei ní kétéi é tɛɛ nyíti mà 'this house is larger than that
house this large it that-
(?) one one'

The (non-Niger-Congo) Chadic language Hausa uses a verb glossed as 'exceed' in comparative constructions, as in (168) [Kraft and Kraft 1973:187].

- (168) yā fī shì kwārī 'it is stronger than the other
it exceed it strength one'

Of the languages for which examples are given here, Efik, Twi, and Ewe appear to resemble Djuka in regard to comparative constructions with '(sur)pass' more than do the other languages cited: Gwari and Yoruba (Kwa), Kpelle (Mande), and Hausa (Chadic). If Efik is indeed a Kwa language as Welmers insists, then the hypothesis is supported that a Kwa substratum was an important source of this construction in Atlantic creoles. (The resem-

blance between Krio and Kwa languages on this point is mentioned, but not illustrated, by Williams [1971:63]. The use of *pas* as a post-VP intensifier and of *pas* + NP in a comparative construction in WAPE is illustrated in Dwyer [n.d.:329].) We may even note particular groups of languages within the Kwa family that are more likely sources of this construction than others.²⁵ If, on the other hand, Efik is best considered not to be Kwa, then we must be more cautious in asserting a Kwa origin for this construction. Given the general disagreement among specialists regarding the details of classification of Kwa languages with regard to Gur or Voltaic, or Benue-Cross (see Mukarovsky [1977]), and other language groupings of this area, there is no point in pursuing these matters further here.

In any event, the hypothesis of a Kwa origin seems more certain for this comparative construction than for the SVC's discussed in Section 1. It should be noted, however, that we have not in this section dealt with data bearing on the role of English or Portuguese influence or of creole or language universals. With regard to the role of universals, it is noteworthy that the description of comparative constructions in Mauritian Creole in Corne [1970:45] makes no mention of any use of a form of '(sur)pass'.

4. Conclusion

Data have been presented from various languages, from both West Africa and elsewhere, both creoles and non-creoles, in comparison with a more detailed account of selected syntactic features of Djuka, a creole of Suriname. The data are most extensive for serial verb constructions, somewhat less extensive for cleft-focus constructions, and even more scanty, at some points merely suggestive, for comparative constructions. The general conclusion, however, seems clear enough: that statements identifying the source of SVC's with a specific language family of West Africa, e.g. Kwa, should be regarded with some scepticism until data from a wider sampling of languages are considered. There is likewise room for some similar scepticism with regard to statements regarding Kwa origins for cleft-focus and comparative construc-

²⁵Greenberg [1966] does in fact group Ewe and Twi together in his sub-classification of Kwa languages.

tions, although the evidence for Kwa origins in these cases is clearer than for SVC's. Even so, the possibility of language universals and universals of creolization being partly responsible for such constructions means that we must continue to examine evidence from creole, post-creole, and non-creole languages from other parts of the world, as well as from earlier stages of West African languages, creoles on both sides of the Atlantic, and the European contact languages.

TABLE OF CONTENTS

Volume X (1979)

Lee Trithart, TOPICALITY: AN ALTERNATIVE TO THE RELATIONAL VIEW OF BANTU PASSIVE	1
Alessandro Duranti, OBJECT CLITIC PRONOUNS IN BANTU AND THE TOPICALITY HIERARCHY	31
Gerard M. Dalgish, THE SYNTAX AND SEMANTICS OF THE MORPHEME <i>ni</i> IN KIVUNJO (CHAGA).	47
Sukari Salomé, TYPOLOGY OF CONDITIONALS AND CONDITIONALS IN HAYA	65
Annie K. Hawkinson, HOMONYMY VERSUS UNITY OF FORM: THE PARTICLE <i>-a</i> IN SWAHILI	81
Josh Ard, A COMPARATIVE AND HISTORICAL STUDY OF LOCATIVE-BASED PERIPHRASTIC VERBAL FORMS IN FULA DIALECTS	119
Larry Hyman, TONOLOGY OF THE BABANKI NOUN	159
Alexandre Kimenyi, DOUBLE NEGATION AND NEGATIVE SHIFT IN KINYARWANDA . .	179
Paul Newman, EXPLAINING HAUSA FEMININES	197
Lee A. Becker, ONCE MORE ON THE NATURE OF DOWNDRIFT	233
Catherine O. Ringen, VOWEL HARMONY IN IGBO AND DIOLA-FOGNY	247
Marion R. Johnson, THE NATURAL HISTORY OF MEINHOF'S LAW IN BANTU	261
Gerard M. Dalgish, SUBJECT IDENTIFICATION STRATEGIES AND FREE WORD ORDER: THE CASE OF SANDAWE	273
Yvette Stoops, THE AFRIKANER AND HIS LANGUAGE	313

Volume XI (1980)

Francesco Antinucci, THE SYNTAX OF INDICATOR PARTICLES IN SOMALI PART TWO: THE CONSTRUCTION OF INTERROGATIVE, NEGATIVE AND NEGATIVE-INTERROGATIVE CLAUSES	1
Zygmunt Frajzyngier, THE VOWEL SYSTEM OF PERO	39
Sukari Salomé, VOWEL COALESCENCE AND TONAL MERGER IN CHAGGA (OLD MOSHI): A NATURAL GENERATIVE APPROACH	75
Mary M. Clark, ON THE TREATMENT OF SYNTACTICALLY-DISTRIBUTED DOWNSTEP .	101
Thomas Bearth and Christa Link, THE TONE PUZZLE OF WOBE	147
Robert A. Leonard, SWAHILI <i>e</i> , <i>ka</i> , AND <i>nge</i> AS SIGNALS OF MEANINGS .	209
Larry M. Hyman, RELATIVE TIME REFERENCE IN THE BAMILEKE TENSE SYSTEM . .	227

George N. Clements and John Goldsmith, WHAT IS DOWNSTEP? A REPLY TO CLARK	239
Bello Ahmad Salim, A NOTE ON THE HAUSA VOICELESS LABIALS	257
Mary M. Clark, A RESPONSE TO CLEMENTS AND GOLDSMITH	261
Marion R. Johnson, A SEMANTIC DESCRIPTION OF TEMPORAL REFERENCE IN THE KIKUYU VERB	269
John P. Hutchison, THE KANURI ASSOCIATIVE POSTPOSITION: A CASE FOR SUBORDINATION	321
Linda Hunter, STRESS IN HAUSA: AN EXPERIMENTAL STUDY	355

Volume XII (1981)

Hounkpatin C. Capo, NASALITY IN GBE: A SYNCHRONIC INTERPRETATION . . .	1
Michael Noonan and Edith Bavin, PARATAXIS IN LANGO	45
Robert F. Port, THE APPLIED SUFFIX IN SWAHILI	71
Ursula Wiesemann and Noël Djemadjouidjiel, PROMINENCE IN NGAMBAY	85
Donald A. Burquest, EVIDENCE FOR OBJECT-VERB ORDERING IN CHADIC	87
Graham Furniss, HAUSA DISYLLABIC VERBS: COMMENTS ON BASE FORMS AND EXTENSIONS	97
Stephen C. Anderson and Jeanette Swackhamer, FROM CONSONANTS TO DOWNSTEP IN PODOKO	131
Elizabeth Jarvis, SOME CONSIDERATIONS IN ESTABLISHING THE BASIC WORD ORDER OF PODOKO	155
Larry M. Hyman, TONAL ACCENT IN SOMALI	169
Anthony Traill and Luiz Ferraz, THE INTERPRETATION OF TONE IN PRINCIPENSE CREOLE	205
David Odden, HISTORICAL EVIDENCE FOR ABSTRACT PHONOLOGICAL ANALYSES . .	219
Jonathan D. Kaye, LES DIPHTONGUES CACHEES DU VATA	225
Kevin G. Donnelly, SHONA VERBAL TONES	245
Robert Hedinger, PRONOUNS IN AKOJSE	277
George L. Huttar, SOME KWA-LIKE FEATURES OF DJUKA SYNTAX	291

Supplement VIII (1981)

PRECIS OF PAPERS FROM THE TWELFTH CONFERENCE ON AFRICAN LINGUISTICS,
STANFORD, APRIL 10-12, 1981

Hounkpatin C. Capo, SIBILANTIZATION IN GBE	1
Chin-Chuan Cheng and Charles W. Kisseberth, HIGH TONE DOUBLING IN TWO MAKUA DIALECTS	5

Benedicte Chorier and Nicholas Faraclas, A CLOSER LOOK AT SHORT HIGH VOWELS IN HAUSA	9
G.N. Clements, AN OUTLINE OF LUGANDA SYLLABLE STRUCTURE	12
J Ronayne Cowan, THE SYNTAX OF BAKA AND KRESH	16
Carol M. Eastman, KISWAHILI DIGLOSSIA IN KENYA: IMPLICATIONS FOR LANGUAGE POLICY	20
S. Ayotunde Ekundayo, YORUBA SERIAL VERB STRING COMMUTABILITY CONSTRAINT .	21
Rosalie Finlayson, HLONIPHA - THE WOMEN'S LANGUAGE OF AVOIDANCE AMONG THE KHOSA	25
Barn. Forson, PHONOLOGICAL REGULARITIES IN AKAN-ENGLISH CODE-SWITCHING . .	29
Zygmunt Frajzyngier, PRE-PRONOMINAL MARKERS IN CHADIC: PROBLEMS AND HYPOTHESES	34
Orin D. Gensler, THE REPRESENTATION OF VOCALIC OBJECT-AFFIXES AND TENSE-AFFIXES IN THE BAKWERI VERB	38
Joseph H. Greenberg, NILO-SAHARAN <u>k</u> - AS A STAGE III ARTICLE	43
Magdalena Hauner, KIUJAMAA: NOTES ON POLITICAL LANGUAGE	46
Georges Herault, L'INFORMATION SEGMENTALE NECESSAIRE A L'ELABORATION DES REGLES TONALES DE L'ADIUKROU	51
Jean-Marie Hombert, FROM PROTO-BENUE-CONGO TO PROTO-BANTU NOUN CLASSES . .	55
John P. Hutchison, THE ROLE OF DEFINITIZATION IN RELATIVE CLAUSE FORMING STRATEGIES	59
Larry M. Hyman, AN AUTOSEGMENTAL ACCENTUAL ACCOUNT OF LUGANDA TONE	64
Larry M. Hyman and Bernard Comrie, COREFERENCE AND LOGOPHORICITY IN GOKANA	69
Phil Jaggard, VARIETIES OF PASSIVE IN HAUSA	73
Jonathan D. Kaye, IMPLOSIVES AS LIQUIDS	78
Jonathan D. Kaye and Monik Charette, TONE SENSITIVE RULES IN DIDA	82
Alexandre Kimenyi, LINKLESS CLAUSES IN BANTU	85
Ian Maddieson, UNUSUAL CONSONANT CLUSTERS AND COMPLEX SEGMENTS IN EGGON .	89
Sam A. Mchombo and Francis Moto, TONE AND THE THEORY OF SYNTAX	92
Roxana Ma Newman and Vincent J. van Heuven, AN ACOUSTIC AND PHONOLOGICAL STUDY OF PRE-PAUSAL VOWEL LENGTH IN HAUSA	95
David Odden, A NONLINEAR APPROACH TO VOWEL LENGTH IN KIMATUUMBI	99
Michael C. Onwuemene, ARVEE-THREE: THE MEANING OF AN IGBO VERBAL SUFFIX	103
Olasope O. Oyelaran, ON THE SCOPE OF THE SERIAL VERB CONSTRUCTION IN YORUBA	106

Geoffrey Rugege, THE INFINITIVE IN KINYARWANDA	111
Ronald P. Schaefer, A STRENGTH HIERARCHY FOR TSWANA	114
Russell G. Schuh, TYPES OF GENITIVE CONSTRUCTIONS IN CHADIC	117
Carol Myers Scotton, RETHINKING INALIENABLE POSSESSION IN SWAHILI: THE EXTENSIVE CASE	121
John Victor Singler, TONE AND INTONATION IN LIBERIAN ENGLISH NEGATION . .	124
Susan U. Stucky, WORD ORDER FREEDOM AND THE STATUS OF THE VERB PHRASE IN MAKUA	128
Judith Timyan, A SEMANTIC ANALYSIS OF QUANTIFICATION: EVIDENCE FROM BAULE	131
A. Traill, KHOISAN CONSONANTS AND PHONOLOGICAL UNIVERSALS	134
Laurice Tuller, VOWEL NEUTRALIZATION IN (DAMAGARAM) HAUSA	136
Ebo Ubahakwe, TOWARDS A STANDARD LITERARY DIALECT OF IGBO	140
Benji Wald, ON THE EVOLUTION OF THE TENSE MARKER NA IN EASTERN BANTU (SUMMARY)	142
Ekkehard Wolff, VOCALISATION PATTERNS, PROSODIES, AND CHADIC RECONSTRUCTIONS	144

INTERNATIONAL COLLOQUIUM ON THE CHADIC LANGUAGE FAMILY

Universität Hamburg
15-18 September 1981

SYMPOSIUM: "Chadic and Afroasiatic"

Tuesday, September 15

Discussants: R. Hetzron, H. Jungraithmayr, P. Newman, Ch. Rabin, R.G. Schuh,
A. Zaborski

P. Newman, "Introduction"

Ch. Rabin, "Problems of inter-branch etymological comparison"

H. Jungraithmayr, "Problems of comparative verb morphology"

R. Schuh, "Change in functions of determiners in Chadic and Afroasiatic"

A. Zaborski, "Chadic stratification"

D. Cohen, "A Hamito-Semiticist poses questions for the Chadicists"

COLLOQUIUM

Wednesday, September 16

Morning

C. Hodge, "Relationship of Afroasiatic to Indo-European"

H. Mukarovsky, "Pronouns and prefix conjugation in Chadic and Hamito-Semitic"

A. Dolgopolsky, "Chadic and Hamito-Semitic etymologies: analysis of personal pronouns"

H. Fleming, "Chadic external relations"

Afternoon

W. Möhlig, "Principles of the Prosodology in Hausa"

G. Furniss, "Some observations on the Verbal System in Hausa"

J. McIntyre, "Hierarchical contexts of Hausa imperative/subjunctive"

Thursday, September 17

Morning

H. Tourneux, "Les emprunts en musgu"

Th. Schumann, "Gender Markers in Masa"

G. Böhm, "Zwei Typen "ergativsprachlicher" Prädikation in tschadischen Sprachen"

F. Frajzyngier, "Marking syntactic relations in Proto-Chadic"

Afternoon

L. Gerhardt, "Linguistic Interferences in the Chadic/Benue-Congo border-area"

A. Rufa'i, "Defining and non-defining relative clauses in Hausa"

N. Skinner, "Polysemy in Afroasiatic"

P. Newman, "Causatives in Hausa"

Friday, September 18

Guarisma, Gladys and Suzy Platiel (eds.). *Dialectologie et Comparatisme en Afrique noire*. Oralité—Documents, 2. Paris: SELAF, 1980. (no price indicated)

This is a collection of papers presented at l'Atelier International de Dialectologie Africaine (Ivry, 2-5 juin 1980), including discussion which followed the papers. The papers are grouped into five sections. I. PRINCIPES METHODOLOGIQUES: W. Möhlig, "La dialectométrie: une méthode de classification en Afrique"; M. Dieu, "Calcul automatique des distances lexicales. Eléments d'une recherche en cours"; Y. Monino, "Dialectologie et parenté génétique des langues. Applications méthodologiques à un groupe homogène de langues"; T. Bearth, "Mesure du degré d'intelligibilité entre dialectes." II. LANGUES BANTOUES: L. Polak, "Note sur la filiation génétique des langues du nord-ouest bantou"; P. Elias et J. Voorhoeve, "La diffusion lexicale en Mbam-Nkam"; J.C. Winter, "International Classification of Kilimanjaro Bantu compared: towards an East African Dialectometry"; G. Philippson, "Comparatisme entre de différentes méthodes lexicostatistiques pour la classification des langues bantoues." III. LANGUES MANDE: D. Creis-

sels, "Variations dialectales dans les systèmes de marques prédicatives des parlers manding"; M.-J. Derive, "Correspondances phonétiques dans les parlers manding"; C. Grégoire, "Les structures relatives en mandé"; V. de Colombel, "Essai de confrontation de points de vue synchronique et diachronique dans la classification de 10 parlers tchadiques du Nord-Cameroun." IV. LANGUES DIVERSES: H. Tourneux, "Les dialects du Musgu (Nord-Cameroun)"; A. Rialland, "Les marques de l'aspect en gurma du Nord et du Sud." V. ANNEXE: Rapport du groupe de travail Bantou Nord-Est: W. Möhlig, G. Philippson, M.F. Rombi, and J.C. Winter, "Classification dialectométrique de quelques parlers swahilis (swahili du Nord et swahili comorien)."

Hutchison, John P. *The Kanuri Language: a Reference Grammar*. Madison, Wisconsin: University of Wisconsin African Studies Program, 1981. (no price indicated)

This is a comprehensive reference grammar of Kanuri, a member of the Saharan Branch of the Nilo-Saharan family. Kanuri is the major language of northeastern Nigeria. The grammar "... is designed to present in a readily accessible fashion, all of the intricacies of the Kanuri language and its grammar. The plethora of Kanuri language material presented in the book is organized in such a way as to be useful to students of the Kanuri language, to linguists and other academics, and to Kanuri people interested in the grammar of their language. The material is organized in pedagogical order throughout the book, and it is hoped that this arrangement will readily lend itself to use in the language teaching classroom." (Introduction, p.5). Hutchison brings fourteen years' study of Kanuri and related dialects to bear in this thorough and detailed grammar.

Hyman, Larry M. *Noni Grammatical Structure*. Southern California Occasional Papers in Linguistics, 9. Los Angeles: Linguistics Department, University of Southern California, 1981. (\$4.00 + 20% postage)

"The present volume... is the third in a series of SCOPIL publications stemming from work on the languages of the Grassfields Bantu region of Cameroon. Though not a complete grammar, this work attempts to present the major grammatical structures of an important language, which although not properly Grassfields Bantu, belongs to the closely related "Beboid" group ..." (p. v) The grammar is divided into 22 chapters organized into five parts: I. Phonology, II. The Noun Phrase, III. VERB STRUCTURE, IV. BASIC SENTENCE STRUCTURE, V. COMPLEX SENTENCES. It concludes with a fairly extensive English-Noni word list and an index.

Nissim, Gabriel, M. *Le Bamiléké-Ghomálá' (Parler de Bandjoun, Cameroun)*. Langues et Civilisations à Tradition Orale, 45. Paris: SELAF, 1981. (no price indicated)

Ghomálá' Bamileke belongs to the Mbam-Nkan group of Grassfields Bantu

languages. The present work contains an introductory chapter on the geographical and linguistic situation. The remainder consists of approximately equal parts devoted to phonology and nominal morphology, the latter describing not only the noun class system, but also the structure of the noun phrase.

UNESCO. *African Languages: Proceedings of the Meeting of Experts on the Transcription and Harmonization of African Languages*. Niamey (Niger), 17-21 July 1978. Paris: UNESCO, 1981. (no price indicated)

A collection of seventeen papers on standardization of orthographies in languages from a number of African countries and on use of modern orthographies in African language literacy.
